APPENDIX C – PUBLIC NOTIFICATIONS

1.0 INTRODUCTION

BETA Group Inc. (BETA) has prepared this Immediate Response Action (IRA) Status and Remedial Monitoring Report (RMR) No. 62 that addresses a release of hazardous materials related to fire-fighting foams and attributed to the former Barnstable County Fire and Rescue Training facility located at 155 South Flint Rock Road in Barnstable, Massachusetts (the FTA or facility). This document has been prepared on behalf of Barnstable County. It is being submitted to the Massachusetts Department of Environmental Protection (MassDEP) – Bureau of Waste Site Cleanup (BWSC) in response to the detection of elevated concentrations of per- and polyfluoroalkyl substances (PFAS), including perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA), in soil and groundwater at the facility and in adjacent areas, in particular to the east, southeast of the facility. This report provides monthly IRA status reporting on the groundwater pumping and treatment systems at the Site for the January 2022 reporting period. In addition, this status report describes the activities and results of the Site-wide groundwater monitoring conducted in January 2022.

This (IRA) Status and Remedial Monitoring Report (RMR) No. 62 is being submitted to MassDEP as an attachment to the BWSC 105 Immediate Response Action (IRA) and BWSC 105A and 105B IRA Remedial Monitoring Report Transmittal Forms. Completed copies of these forms prior to electronic signature are included in Appendix A.

As current owners of the FTA, Barnstable County, as represented by the Barnstable County Commissioners, have been named as the Potentially Responsible Party (PRP) for this release. The contact person for the Disposal Site and release is:

Steve Tebo, Asset and Infrastructure Manager Telephone: 508-375-6643
Barnstable County Email: stebo@barnstablecounty.org

3195 Main Street Barnstable, MA 02630

BETA is performing MCP Response Actions on behalf of the Barnstable County Commissioners. The Licensed Site Professional (LSP) overseeing Response Actions for this release is:

Roger Thibault, P.E., LSP No. 1443

Telephone: 401-333-2382
BETA Group Inc.

Email: rthibault@beta-inc.com

701 George Washington Highway

2.0 GENERAL DISPOSAL SITE INFORMATION

2.1 PROPERTY AND SITE DESCRIPTION

The former Barnstable County Fire and Rescue Training FTA (FTA or facility) is located on South Flint Rock Road in the Town of Barnstable. It appears on the United States Geological Survey (USGS) Topographic Quadrangle – Hyannis, Massachusetts -Figure 1 – Site Location map, prepared from a portion of the referenced USGS Topographic Quadrangle map. The Site is currently zoned for industrial use.

For the purposes of this and future MCP submittals, the property on which the FTA is located will be referred to as the FTA or facility. FTA or facility will also refer to the structures, land and former functions of the FTA.

In accordance with the MCP definitions, where contamination attributable to the PFAS releases associated with firefighting foams and training on the FTA have come to be located will be referred to as the Disposal Site or Site.

Following the completion of the capping and select demolition project in November 2021, the 6.2 acre FTA is improved by one primary building: an auxiliary fire station and training building (with two classrooms, administrative offices, and two apparatus bays), two Quonset hut sheds used for storage of County equipment. Refer to Figure 2. The former fire training apparatus has been demolished and/or removed from the Site. The FTA is secured by chain link fencing and a locked gate. The FTA is listed on the Town of Barnstable Assessor's on-line records as Map 313, Lot 007. The current owner-of-record is the County of Barnstable, who acquired the facility from the Town of Barnstable in 1983 by deed recorded June 3, 1983, Barnstable Registry of Deeds, Book 3759, Page 39. Utilities servicing the FTA include municipal water, an underground septic system, aboveground electricity and telecommunications.

The FTA was first constructed on land donated to the Town of Barnstable by the Cobb Trust in 1955. The FTA had been used for public safety training since the 1950's. The FTA was formerly used for public safety training by fire departments and fire districts from throughout Barnstable County, fire departments outside of Barnstable County, and other public and private institutions. Live fire training using firefighting foams, including aqueous film forming foams (AFFF), was conducted at the FTA for decades by fire districts and departments that used their own foam brought to the FTA in the apparatus of the organization participating in the training. Foam training exercises at the FTA ceased in 2009 according to FTA officials. Water training activities ceased in June 2019.

Land surrounding the FTA is primarily undeveloped, wooded land within a public water supply protection area. Flintrock Pond occupies approximately 6 acres directly to the west of the FTA. Several public water supply wells and their related facilities are located to the east, southeast, and west of the FTA.

At this time, the preliminary MCP Disposal Site (the Site) associated with RTN 4-26179 is considered to comprise approximately the majority of the FTA, the westerly adjacent Flintrock Pond, and a large woodland area to the southeast of the FTA, approaching Mary Dunn Pond.

The southeastern portion of the Site includes land owned by the Town of Barnstable, which is crossed by two electric power transmission lines running presumably within easements. Private industrial properties and related structures are located approximately 500 to 1,000 feet south of the Site. The Barnstable Municipal Airport is located to the west (runway 15 – 33) and south of the Site and the FTA.

The nearest residential properties are located approximately ¼ mile to the north of the Site. Based on 2010 U.S. Census data, the residential population located within a ½ mile radius of the Site is estimated to be less than 150 people. There are no known Institutions located within 500 feet of the Site. The municipal well pumping facilities referenced above (not part of the FTA) are not staffed full-time.

2.2 LATITUDE AND LONGITUDE / UNIVERSAL TRANSVERSE MERCATOR'S

The coordinates for the Site are shown below. For simplicity, these coordinates are for the southerly end of the FTA.

<u>Latitude/Longitude</u> Latitude: 41° 40′ 41.53″N

Longitude: 70° 17′ 7.82″ E

UTM Coordinates Easting: 393,002

Northing: 4,614,847

2.3 MASSDEP METHOD 1 CATEGORIES

2.3.1 GROUND WATER CATEGORY

As noted, the Site is located within a Zone II Public Water Supply Protection Area and a Medium-Yield Sole Source Aquifer.

Therefore, MCP Method 1 Ground Water Category 1 (GW-1) applies to the Site. Groundwater at the Site is also categorized as Method 1 GW-2 because groundwater has been measured at depths less than 15 feet below grade and an occupied building is located within the FTA facility.

All ground waters within the Commonwealth are considered a potential source of discharge to surface waters and shall be categorized, at a minimum, as Method 1 GW-3. Therefore, the applicable Method 1 Ground Water Categories for the Site are GW-1, GW-2 and GW-3.

2.3.2 SOIL CATEGORY

Soil categorization is based upon the type of human receptor and three potential exposure criteria: frequency of use, intensity of use, and accessibility of soil. The FTA portion of the Site is occupied by a former fire and rescue training facility. Based on the nature of the facility, children are assumed to be "not present." Adults who work at the site as staff members are assumed to be present at "high frequency." Impacted soils have been identified beneath unpaved areas at depths ranging from approximately less than 3 to 15 feet below the ground surface. Therefore, impacted soils at the FTA are considered "potentially accessible."

Only groundwater impacts at significant depths below the ground surface have been identified at the remainder of the Site (outside of the FTA), which consists of undeveloped, industrially zoned land, a portion of a utility easement, and three unmanned public water supply well stations.

Intensity of use in regard to soil disturbance in the release area for adults at the Site is considered "high" because the area of impact at the FTA could potentially be disturbed during Site activities. However, former on-Site training activities were of relatively short duration with potential high intensity use. Current Site maintenance-related activities are similar in terms of duration and potential intensity. Therefore, for current Site uses, soils at the Site are categorized as Soil Category S-2. The applicable Soil Categories for current Site uses have been identified as S-2/GW-1, S-2/GW-2 and S-2/GW-3.

The applicable Soil Categories for unrestricted future Site uses are S-1/GW-1, S-1/GW-2 and S-1/GW-3.

3.0 DISPOSAL SITE HISTORY AND OVERVIEW

The Site has historically been the subject of four MassDEP RTNs: 4-190, 4-11707, 4-20021, and 4-26179. This IRA Plan Modification is being submitted for RTN 4-26179 only. The original RTN, 4-190, is being managed separately; closure has been achieved for the remaining two RTNs.

3.1 RELEASE HISTORY AND DESCRIPTION - RTN 4-26179 (PFAS RELEASE)

In May 2012, USEPA issued their final rule "Revisions to the Unregulated Contaminant Monitoring Rule (UCMR3) for Public Water Systems," which was a national sampling mandate for "emerging contaminants" in public water supplies. The required sampling list included several PFAS compounds, including but not limited to PFOS and PFOA. In November 2013, samples were collected from Mary Dunn supply wells MD-1, MD-2 and MD-3 and analyzed for PFAS.

At the time of the testing, the US EPA Provisional Health Advisory (HA) was 0.20 micrograms per liter (µg/L) for PFOS. Analytical results revealed evidence of PFOS contamination in all three wells sampled. MD-1 and MD-2 were temporarily removed from service. MD-3 was apparently not in use at that time. A treatment system that utilizes granular activated carbon (GAC) was later implemented for MD-1 and MD-2 [July 2015] by the Hyannis Water Department. In 2016, GAC treatment was also implemented for MD-3. [See below].

In November 2013, Barnstable County personnel also collected soil and groundwater samples from the FTA property, located approximately 1,000 feet west of the Mary Dunn wells, and submitted them for laboratory analysis of PFAS. Groundwater analytical results revealed that FTA groundwater was impacted by PFOS and MassDEP was subsequently notified.

PFOS was also detected in soil at the FTA and in surface water and sediment within the adjacent Flintrock Pond. As summarized in the Notice of Responsibility (NOR) issued by MassDEP on August 4, 2016 (see below), based on the detected PFAS concentrations in soil and groundwater at the FTA and the inferred groundwater flow direction being to the southeast (toward the Mary Dunn wells), MassDEP determined that the releases of PFAS from the use of AFFF at the FTA is a source of PFAS detected in the Mary Dunn wells.

As a voluntary measure, Barnstable County refurbished the former perchlorate pump and treat system located at the FTA to help remediate and contain the PFOS apparently migrating from the facility. The groundwater pumping and treatment system (GWPTS) was re-started using granular activated carbon (GAC) in the former perchlorate treatment vessels for treatment in July 2015. The system utilizes a groundwater recovery well, PRW-4, located approximately 800 feet southeast of the FTA. The groundwater treatment system (GWTS) itself is located in a structure on the FTA grounds.

In August 2015, Barnstable County funded a more detailed hydrogeological assessment, continued implementation of a groundwater pump and treat system to capture PFOS upgradient of the Mary Dunn wells, and additional assessment and immediate response actions. The Cape Cod Commission evaluated subsurface soil and groundwater conditions at the FTA facility as part of the IRA assessment activities. The soil results indicated a broad area of PFOS contamination throughout the subsurface. The highest PFOS concentrations were detected near the southwestern corner of the FTA, a location subsequently referred to as the hot spot.

Groundwater analytical results from the 2015 assessment revealed PFOS contamination ranging from less than 0.070 μ g/L (the current US EPA HA) to over 4.0 μ g/L. The groundwater samples were collected from monitoring wells across the area between the FTA and the Mary Dunn wells. Like the soil results, the highest PFOS concentrations were detected near the southwestern corner of the FTA.

In May 2016, US EPA revised/lowered its HA for PFAS from 0.20 μ g/L of PFOS and PFOA to 0.070 μ g/L for either compound or the total of the two. EPA noted that the HA was for drinking water exposures only. In response to the lowered HA PFAS concentrations, on August 4, 2016, MassDEP issued a Notice of Responsibility (NOR) to Barnstable County and required submittal of an Immediate Response Action (IRA) Plan no later than September 15, 2016. MassDEP requested that the Site owner evaluate potential Imminent Hazards relative to downgradient public and private water supply wells.

MassDEP indicated that this evaluation should include identification of all nearby public and private water supply wells, review of any existing analytical data for those wells, and sampling and analysis of any nearby wells that have not been sampled for PFAS.

MassDEP also stated that the IRA Plan should include measures to prevent, eliminate, and/or abate any hazards associated with the consumption of drinking water impacted by PFAS above the HA level of 0.070 ug/L.

MassDEP also required, as part of the IRA, activities to reduce the mass of PFAS at the FTA and the concentrations of PFAS in groundwater migrating from the FTA facility, such as excavating the soil hot spot and expanding the existing groundwater treatment system to decrease the mass of PFAS in groundwater.

On September 27, 2016, on behalf of Barnstable County, the Cape Cod Commission submitted an IRA Plan to MassDEP to address the PFOS/PFOA impacts. The IRA Plan included an evaluation of imminent hazards to downgradient public and private water supplies, specific plans for a Hot Spot removal action, and plans for an interim expansion of the existing groundwater pump and treatment system.

The proposed IRA to address the soil Hot Spot was to excavate up to 200 cubic yards from a 400 square foot area for off-Site disposal. The Hot Spot soil was removed in January 2017, reducing the primary source of PFOS contamination leaching into groundwater. However, post-removal grading and settling of the backfill in the Hot Spot area left it prone to infiltration of runoff from the southern portion of the FTA.

Between December 2016 and February 2018, the Cape Cod Commission submitted 15 IRA Status and Remedial Monitoring Reports (RMRs) to MassDEP for the PFAS release. The RMRs addressed the FTA GWPTS, which recovers and treats approximately 20,000 to 50,000 gallons per day (gpd) of groundwater from well PRW-4. The Site groundwater pump and treat system is working to reduce PFAS concentrations in the aquifer before it reaches the Mary Dunn municipal wells and treatment systems. Refer to Section 3.2 for further information regarding the on-Site GWPTS.

The Mary Dunn wells are equipped with GAC treatment systems to remove PFAS. The Mary Dunn wells as the well as the GAC treatment systems are operated by SUEZ North America under contract with the HWSD. The GAC treatment of the Mary Dunn wells is actively preventing a potential Imminent Hazard to the Hyannis community by removing the PFAS compounds from the water supply. A Settlement Agreement between the Town of Barnstable and Barnstable County requires the County to fund a portion of the costs associated with operating the Mary Dunn wells treatment systems as well as a portion of the capital costs to install the GAC systems. Timely exchange of pumping and performance data related to the treatment of the Mary Dunn well water supplies to verify effectiveness of the IRA is noted in the Settlement Agreement between the parties.

On behalf of Barnstable County, BETA has submitted IRA Status reports and RMRs since March 2018. IRA Status and RMR reports have been submitted monthly since December 13, 2016. As detailed in recent IRA Status and RMR reports, including this report, groundwater monitoring data for locations across the Disposal Site confirm that elevated PFAS concentrations are still present in Site groundwater.

Analytical data from select monitoring wells indicate that PFAS concentrations in groundwater sampled in the former Hot Spot area have significantly decreased (following the Phase 1 stormwater improvements repair of the cap under the June 28, 2018 IRA Plan Modification); PFAS concentrations remain stable in groundwater sampled from wells east of the FTA; and PFAS concentrations remain elevated in groundwater sampled from within the area southeast of the FTA between the facility and the Mary Dunn wells. See Section 4.3 for the most recent (July 2021) groundwater monitoring data.

3.2 GROUNDWATER PUMP AND TREAT SYSTEMS

Response actions to address the early 1990s petroleum releases and the later detection of perchlorate included extensive subsurface assessment including installation of a significant network of monitoring wells.

In addition, to help remediate and control migration from the petroleum and perchlorate releases, in 1998 and 2007, respectively, response actions included the installation, upgrade, and/or renovation of a GWPTS at the Site. In July 2015 the decommissioned GWTS, formerly used to treat for perchlorate, was renovated and re-started to help remediate and contain the PFAS migration from the FTA; see below. The operational GWPTS was later noted in the NOR issued by MassDEP in August 2016 as part of the on-going IRAs. The NOR also requested that Barnstable County install additional recovery wells or increase the groundwater recovery rate to increase PFAS removal; see discussion of GWTS# 2 below. The approximate locations of key components of the GWPTS that are located on the FTA are shown on Figure 2 – Site Plan Detail. The location of the operating recovery well, PRW-4, and the approximate route of the force mains (two, 2-inch polyethylene pipes) are shown on Figure 3 – Site Plan.

GWTS # 1

In July 2015, the primary influent/recovery well pump installed in recovery well PRW-4 was repaired, a new variable frequency drive (VFD) unit pump was installed in the treatment system, and all accompanying electrical components were evaluated and repaired. The system was restarted in July 2015 upon the installation of 1500 pounds (lbs.) of aqueous phase GAC (Filtrasorb 400 virgin GAC) into each of the two, existing Siemens treatment vessels. The "capture zone" of PRW-4 was reportedly estimated to be 200 ft. at 40 gallons per minute (gpm). Groundwater is pumped from recovery well PRW-4, through two, 2-inch dia. HDPE, eight-hundred-foot force mains to the treatment building on the FTA; see Figures 2 and 3.

The groundwater is discharged to an equalization tank, then filtered through a 5–10-micron size bag filter, and pumped through the two (in series) GAC vessels. The treated groundwater is discharged by gravity to several large recharge chambers in a north-central location of the FTA, upgradient of the recovery well and approximately cross-gradient of the highest levels of PFAS contamination detected at the FTA property. See Fig. 2 for the location of the recharge basins. As appropriate to prevent breakthrough of the PFAS6 compounds, the GAC is periodically changed out.

GWTS # 2

As noted, the NOR also requested that Barnstable County increase the groundwater recovery and treatment rate to increase PFAS removal from the aquifer. In November 2019, a second, supplemental treatment system was installed, designated as GWTS#2, to treat water from the existing recovery well and better use its extraction capacity. One of the two force mains was re-piped and connected via hose and hard piping to GWTS#2. The system is contained in a mobile structure (former shipping container) and is designed to treat PFAS-impacted groundwater (via adsorption technology with liquid phase granular activated carbon) at a target flow rate of approximately 30 gpm.

Since the inception of treatment for PFAS in 2015, the spent GAC is collected by the supplier, Calgon Carbon Corp., during the changeout procedure and transported to their facility for standard thermal regeneration or destruction. As noted above, the FTA GWPTS uses virgin GAC supplied by Calgon.

Currently, Groundwater Treatment Technologies, LLC (GWTT) is contracted by Barnstable County to provide O&M of the GWTS, including but not limited to bag filter checks and replacements, VFD pump monitoring, carbon vessel backwashing, and GAC replacement oversight.

Additionally, BETA collects monthly samples for PFAS from both systems to check their treatment performance (See section 4.1).

3.3 PHASE I INITIAL SITE INVESTIGATION AND TIER CLASSIFICATION

In May 2018, a Phase I Initial Site Investigation (ISI) Report and Tier Classification Submittal was submitted to MassDEP by BETA (formerly Nover-Armstrong Associates) on behalf of Barnstable County in response to the discovery of concentrations of PFAS compounds in soil and groundwater exceeding applicable USEPA Health Advisory (HA) levels. The Phase I ISI confirmed that the primary contaminant of concern is PFOS and, to a lesser extent, PFOA.

Based on the compiled Phase I Initial Site Investigation data, BETA opined in the Phase I report that continuation of the IRA activities and additional assessment and, potentially, additional remedial Response Actions are warranted at the Disposal Site.

A Phase II Comprehensive Site Assessment Conceptual Scope of Work (SOW) was submitted with the Phase I ISI outlining the scope, nature of investigation, and sample programs proposed to characterize the risk of harm posed to health, safety, public welfare, and the environment (for regulatory closure). The Phase II SOW proposed additional remedial and/or response actions such as continued monitoring of the Site groundwater conditions, potential soil removal or modifications to the existing groundwater treatment system to be implemented in the near future. At a later date, MassDEP indicated that a formal Phase II Comprehensive Site Assessment SOW was required in addition to the Conceptual SOW.

A Tier Classification was submitted to MassDEP concurrently with the Phase I Report. Based on the need to continue remedial actions as IRAs under the current IRA Plan, and on the continuing need to abate a potential Imminent Hazard condition related to impacts to public water supplies, the RTN 4-26179 release was classified as Tier I.

3.4 ENVIRONMENTAL SETTING AND SENSITIVE RECEPTORS

BETA's review of the Massachusetts GIS Priority Resources (21E) mapping (Figure 4) revealed that the Site is located within a Zone II Public Water Supply Protection Area and a Medium-Yield Sole Source Aquifer. The FTA is situated to the west and most likely upgradient of the Mary Dunn public water supply wells 1, 2, and 3 under pumping conditions. Mary Dunn Wells 1, 2, and 3, owned by the Town of Barnstable through the Hyannis Water Supply Division (HWSD) of the Barnstable Department of Public Works (DPW), are located within the preliminary Disposal Site boundary due to the detections of PFAS in the groundwater at those wells. There are no known private potable water wells located within 500 feet of the Site.

Mary Dunn Well 3 (MD-3), which is the nearest public water supply well to the facility, has been documented to pump at an average rate of 380 to 450 gallons per minute (gpm). Mary Dunn Wells 1 and 2 (MD-1 and MD-2) are located approximately 1600 feet and 1800 feet, respectively, southwest of the FTA. These wells have been reported to have been pumped at rates of 400 gpm, each.

Airport Well 1, also owned by HWSD, is located further to the southeast of the Site, south of Mary Dunn Pond. Two other public water supply wells, identified as Barnstable Fire District (BFD) wells BFD-2 and BFD-5, are located to the west and most likely upgradient of the Site. The BFD wells are not operated by or part of the Hyannis Water System.

According to the USGS Topographic Quadrangle – Hyannis, Massachusetts, elevations at the Site are approximately 30 to 50 feet above mean sea level (MSL). Topography of the Site can be categorized as generally flat with slight to moderate slopes downward to the west and southeast, toward Flintrock Pond and Mary Dunn Pond, respectively.

The nearest surface water bodies to the Site are Flintrock Pond and an unnamed Pond; Flintrock Pond is located west adjacent to the FTA and the unnamed Pond is located northeast adjacent to the FTA (as depicted in Figures 2 and 3). A portion of Flintrock Pond is located within the preliminary MCP Disposal Site Boundary based on the detection of PFAS in sediment and surface water. There are no streams or wetlands located at the Site.

3.5 FLINTROCK POND ASSESSMENTS

Per the Order of Conditions: Special Conditions of Approval (SE3-5606), Item 17, the Town of Barnstable Conservation Commission required "new testing results for PFAS in Flintrock Pond." From November 2019 to October 2020, BETA has conducted surface water and sediment sampling at Flintrock Pond.

Elevated concentrations of the total summed of the five PFAs chemicals (PFOS, PFOA, PFNA, PFHxS, and PFHpA) were documented in the pond sediments and surface water; however, no MassDEP or US EPA regulatory standards or guidelines for sediment and surface water are available for comparison. Later compilations of the PFAS data includes the sixth PFAS compound regulated under the MCP, Perfluorodecanoic Acid (PFDA).

Concentrations of PFAS documented within Pond sediments are dominated by the PFOS and PFHxS compounds and increase with distance from the Pond's bank. Refer to the previously completed IRA Status Reports submitted to MassDEP for complete information on the assessment to date of Flintrock Pond.

Future Assessment

In response to Commission input and to meet MCP requirements, a comprehensive assessment program for the pond is under development to be implemented during the Phase II CSA. Barnstable County and BETA, in conjunction with Barnstable County dredging department, will install/construct cable crossings of the pond with a means to move a small float or a boat to cross the pond, while systematically obtaining sediment samples from relatively consistent and reproducible locations throughout the Pond. The planned sediment sampling will support the pond's ecological risk assessment per the requirements of 310 CMR 40.0830 and at 40.0995. The additional sampling, especially spatially, will also support the overall conceptual site model as part of Phase II Site assessment and the selection and implementation of a remedial alternative for the Disposal Site. The proposed program is presented in the recently submitted Public Comment Draft Phase II Comprehensive Site Assessment SOW; see Section 3.8.

3.6 SAMPLING AND ANALYSIS FOR PFAS

Following the collection of aqueous and/or soil samples for the analysis of PFAS compounds, BETA submits all samples to Bureau Veritas Laboratories (BV Labs) (formerly Maxxam Analytical) for the analysis of PFAS via USEPA Method 537 modified.

BV Labs is an accredited laboratory located in Mississauga, Ontario that has performed the PFAS analyses for all samples collected from the Disposal Site since the assessment for PFAS impacts began. BV Labs reports the concentrations of 23 PFAS compounds from aqueous and soil samples with laboratory detection limits as low as 2.0 ng/L (0.002 μ g/L). However, for the purposes of achieving the low laboratory detection limits to compare against the MCP GW-1 Standard of 20 ng/L for the monthly performance samples collected at the treatment systems, BV Labs is only able to report 21 PFAS compounds; two of the fluorotelomers are not reported.

Upon receipt of a laboratory report, BETA reviews the concentration data as well as the laboratory case narrative and quality assurance report to ensure no bias is present. BETA summarizes and tabulates the analytical results of six PFAS compounds (PFOS, PFOA, PFNA, PFHxS, PFHpA, and PFDA) based on the MassDEP MCP PFAS risk standards (December 2019). BETA presents the tabulated data and includes the laboratory analytical reports (or Certificates of Analysis) for that reporting period in the monthly IRA Status and RMR reports; the summary data tables, and laboratory analytical reports are included as attachments to these reports.

3.7 PUBLIC INVOLVEMENT

In January 2019, a petition from a group of residents of Barnstable and Hyannis, MA was received, requesting that the Site be designated a Public Involvement Plan (PIP) Site. In response to the request from the local petitioners, Barnstable County designated the Site as a PIP site and began PIP activities in accordance with 310 CMR 40.01404. Notification of the Site Designation and the initial public meeting was provided to all petitioners and the Town of Barnstable officials in writing in February 2019.

On May 2, 2019, a public meeting was held, and a Draft Public Involvement Plan (PIP) was prepared, presented, and distributed. Public comments (as they relate to the response actions implemented for the release of PFAS at the Site and are in accordance with 310 CMR 40.01404) were incorporated into the final Plan, which was finalized on June 27, 2019. See Section 3.8 for information on recent public involvement activities related to the Draft Phase II Comprehensive Site Assessment (CSA) Scope of Work.

3.8 PUBLIC COMMENT DRAFT PHASE II COMPREHENSIVE SITE ASSESSMENT SCOPE OF WORK

As noted in 3.3, MassDEP indicated that a formal Phase II Comprehensive Site Assessment (CSA) SOW was required for the RTN 4-26179 PFAS Release Site. On July 16, 2021, a Public Comment Draft Phase II Comprehensive Site Assessment (CSA) Scope of Work was submitted via eDEP and was made available for public comment on July 20, 2021. The Draft Phase II CSA SOW document described the robust assessment activities proposed to meet the Phase II objectives stated in the MCP at 310 CMR 40.0833. A Public Information Meeting was held virtually on August 18, 2021. Per Section 4.23 of the Final PIP, public comments were accepted on the Draft Phase II CSA SOW until August 26, 2021. Several sets of public comment were received. The significantly revised and expanded Phase II CSA SOW is being finalized at this time. Public comments are being addressed and will be incorporated into the final Phase II CSA as appropriate and feasible.

4.0 HISTORICALLY AND RECENTLY COMPLETED IRA ACTIVITIES

Since the submittal of the IRA Plan in September 2016, remedial response actions and assessment activities have continued to address the PFAS impacts at the Site.

Most notably, the Barnstable County and the Cape Cod Commission implemented response actions to refurbish and re-start a decommissioned groundwater pump and treatment system at the Site in 2015.

Details regarding the refurbishment and initial operation of this pump and treatment system were in included in the September 2016 IRA Plan. Following the mobilization and start-up of a second groundwater treatment system in November 2019, the refurbished system has been referred to as GWTS #1 or the primary system in MCP filings.

Barnstable County and the Cape Cod Commission oversaw the excavation of 200 cubic yards of PFAS impacted soils from the former "Hot Spot" area (a 400 square foot area) for off-Site disposal in January 2017. Details regarding the Hot Spot soil removal were in included in the January 2017 IRA Status Report.

From December 2018 through February 2019, Barnstable County implemented the regrading and temporary capping of the southwest corner of the FTA, including the former Hot Spot area, with related stormwater controls, termed the Phase I Stormwater Management Improvements/IRA Plan Modification. Additional details regarding the Phase I Stormwater Management Improvements were included in the February 2019 Reporting Period IRA Status No. 27 Report.

In November 2019, the County procured (rented) and started a second treatment system, GWTS #2, in an effort to increase the treatment capacity of groundwater from PRW-4. As a result, groundwater conveyed from PRW-4 was split and re-piped to both GWTS #1 and GWTS #2. Therefore, although there are two treatment systems, they both treat water from one source, recovery well PRW-4. Collectively, the recovery well and the two treatment systems are referred to as the groundwater pump and treatment system (GWPTS).

The following is a summary of the additional continuing and recently completed IRA response actions at the Site. Additional details regarding these IRA response actions can be found in previous IRA Status submittals.

4.1 CONTINUING OPERATION & MAINTENANCE OF GWTS

Cape Cod Commission oversaw and documented the GWPTS performance on behalf of Barnstable County from July 2015 through February 2018. The Cape Cod Commission also conducted groundwater monitoring and oversaw operation and maintenance of the recovery well, PRW-4.

Monthly performance monitoring samples have been collected since GWTS #1 startup in July 2015, from the influent (PRW-4), midpoint, and effluent sample locations. Since November 2019, performance samples have been collected monthly from both GWTS #1 and GWTS #2.

Periodic monitoring of the system is required to maintain operation of the VFD and recovery well pump including carbon exchanges, regular backwashing of the carbon vessels, force mains cleanouts, and replacement of the recovery well pumps. This work is currently performed by a wastewater treatment system operator, Groundwater Treatment and Technology (GWTT), under contract to the County. Since November 2019, GWTT maintains and operates both GWTS#1 and GWTS#2 systems.

IRA activities related to the operation and maintenance of the GWPTS conducted during earlier reporting periods have been described in detail in previously completed IRA Status Reports submitted to MassDEP. Refer to those submittals for complete information. The previously submitted documents are available in MassDEP Sites Database; refer to the follow link to access these reports.

https://eeaonline.eea.state.ma.us/portal#!/wastesite/4-0026179.

On behalf of Barnstable County, BETA has submitted the IRA monthly remedial monitoring reports and status reports summarizing pump and treat system operations for the respective reporting period since March 2018. These submittals have presented a running, summary data table for the PFAS analytical data including the monthly system samples and the respective laboratory analytical report. As noted

previously, the laboratory reports for monthly GWTS performance monitoring provide the results for 21 PFAS compounds in order to allow for lower laboratory reporting limits.

Health Advisories and Regulatory Standards Used for Comparison

During the initial two years of the GWPTS operation (July 2016 through June 2018), the USEPA revised Health Advisory (HA) of 0.070 µg/L for two PFAS chemicals, Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS), was used for comparison to the analytical results of GWPTS performance samples. The HA (revised downward to 0.070 µg/L in July 2016) applied to each compound individually or for the total concentration of the two (PFOS and PFOA). Subsequently, MassDEP adopted the USEPA HA. The USEPA considers its HA to still be in effect. However, for MCP purposes it has been superseded by MassDEP guidelines and regulatory actions.

On June 11, 2018, MassDEP's Office of Research and Standards (ORS) issued an updated ORS Guideline/HA that applied to the individual concentrations, or the total summed of five PFAS chemicals: PFOS, PFOA, Perfluorononanoic Acid (PFNA), Perfluorohexanesulfonic Acid (PFHxS), and Perfluoroheptanoic Acid (PFHpA). From June 11, 2018, until December 2019, individual concentrations of any of these five compounds or the total concentrations of all were compared to the MassDEP ORS HA of 0.070 µg/L.

On April 19, 2019, MassDEP released the Public Comment Draft of proposed revisions to the MCP, which included proposed Method 1 groundwater risk standards for the five PFAS compounds, plus an additional PFAS compound, Perfluorodecanoic Acid (PFDA). A Method 1 GW-1 risk standard of 0.020 μ g/L was proposed for the individual concentrations of any of these six compounds or the total concentrations of all six. In December 2019, MassDEP published final MCP Method 1 risk standards for the PFAS6 compounds with an effective implementation date of December 27, 2019. From May 2019 through the current reporting period, tabulated treatment system analytical results have been compared to the six regulated PFAS compounds. The final MCP PFAS risk standards for groundwater include the 6 PFAS compounds of concern (PFAS6) listed above and the 0.020 μ g/L¹ which is the GW-1 numerical risk standard for each compound or for the total of the PFAS6. These MCP risk standards are included in all relevant tables in the monthly and quarterly monitoring reports.

Except where noted (due to older data), total PFAS concentrations reported and discussed in this report are the sum of concentrations of the PFAS6 compounds included in the final MCP risk standards of December 27, 2019.

4.2 CURRENT OPERATION & MAINTENANCE OF GWPT SYSTEM

During the January 2022 reporting period, the primary treatment system (GWTS #1) and secondary system (GWTS #2) were in operation for approximately 29 days. On January 29, 2022, due to inclement winter weather, the Site lost power and subsequently the systems shutdown. Power to the systems was restored on February 1, 2022. On January 25, 2022, BETA collected performance samples from both GWTS #1 and GWTS #2 systems prior to the system shutdown and both were in operation at the time of sample collection.

¹ Concentrations of PFAS are presented in the data tables of this report in nanograms per liter (ng/L), also referred to as parts per trillion (ppt) and are reported by the laboratory in those units. However the published MCP Method GW-1 numerical risk standards for PFAS compounds (PFOS, PFOA, PFNA, PFHpA, PFHxS, and PFDA) are in presented in or micrograms per liter (μg/L), also referred to as parts per billion (ppb). In the relevant sections of this report, results are shown in both units.

-

4.2.1 REMEDIAL MONITORING REPORT – GWTS #1

GWTS # 1 System Monitoring Results

As noted, system samples were collected on January 25, 2022, from the Influent (PRW-4), Midpoint and Effluent ports and were submitted to Bureau Veritas Laboratories (formerly Maxxam Analytics) of Mississauga, Ontario (Bureau Veritas) for the laboratory analysis of Total PFAS via USEPA Method 537 M. For the analysis of the treatment system performance samples, Bureau Veritas uses a low-level detection variant of the US EPA 537M to achieve the lowest method detection limits (MDLs) and reportable detection limits (RDLs) to allow for comparison to the MCP Method 1 GW-1 risk standards. This method provides RDLs in the range of 2 to 4 ng/L and MDLs below 1 ng/L for the list of PFAS analytes reported by the laboratory. Bureau Veritas reports the results for 21 PFAS compounds, including two (2) PFAS precursor fluorotelomers. Details are presented in the laboratory report.

Refer to the attached Table 1A, for a summary of the GWTS #1 PFAS analytical data. The complete laboratory report is attached in Appendix B.

Recovery well PRW-4 is the source of the Influent groundwater. The total sum of the six Massachusetts regulated PFAS (PFAS6) concentrations in the Influent (PRW-4) sample was 795.5 ng/L (0.796 μ g/L), well above the GW-1 risk standards. However, the total PFAS6 concentrations in the Influent has continued in a downward trend since November 2020. Five of the six regulated PFAS compounds were detected at concentrations exceeding the MCP GW-1 risk standard (0.020 μ g/I); PFDA was detected at a concentration below the MCP GW-1 standard. Based on the splitting of flow from PRW-4 to both groundwater treatment systems, the Influent analytical results apply to GWTS #2, as well as GWTS #1.

The PFAS6 compounds were detected at concentrations above the laboratory reporting limits in the January 2022 Midpoint; three of the PFAS6 compounds, PFOS, PFHxS, and PFHpA, were detected at concentrations above the GW-1 risk standard. The sum of the PFAS6 compounds (from this Midpoint sample) was 351 ng/L, well above the GW-1 risk standard and indicating PFAS breakthrough of GAC vessel #1.

The PFAS6 compounds were not detected in the Effluent sample above the laboratory reporting limits, which were sufficiently low to allow for comparison to the GW-1 risk standard. Furthermore, the remaining 15 PFAS compounds reported in the full laboratory report were below the laboratory's method detection limits (MDLs) in the Effluent sample; the MDLs ranged from __ to __ ng/l. Refer to the Table 1A and the complete laboratory report in Appendix B for the concentrations of the remaining unregulated PFAS compounds as well as the laboratory RDLs and MDLs.

GWTS #1 Operational Details

The attached Table 2A presents the GWTS #1 performance data. As presented on Table 2A, the system was off from January 29 to January 31 (For the January 2022 reporting period) due to loss of power from inclement weather on January 29, 2022. Therefore, the system was operational for approximately 29 days during the January 2022 reporting period.

The combined estimated, instantaneous Influent flow rates (for both systems) ranged from approximately 53.6 gpm to 45.1 gpm (the approximate average instantaneous flow rate for both systems)). Due to the method used to estimate the instantaneous influent flow rate (timing of rise of groundwater in the GWTS #1 Equalization Tank with <u>both</u> force mains discharging to it), the estimated influent flow rates noted above and on Table 2A (shown in the Combined Instantaneous Estimated Flow Rate column) apply to both systems, combined.

Therefore, during the normal mode of operation, with the flow from each force main flowing to only one system, it is assumed that roughly 50% of the instantaneous influent rates stated above actually flows to GWTS #1 for treatment. Those values are shown on Table 2A in the Estimated Instantaneous Flow Rate column.

As noted, the average Estimated Instantaneous Influent Flow Rate for GWTS #1 alone was approximately 24.6 gpm. The Instantaneous Influent Flow Rates are indicative of the output of PRW-4 and conveyance capacity of the influent force mains from the well to the treatment systems.

For the January 2022 reporting period, the overall (average) system flow rate and gallons of groundwater treated are based on the Effluent flow meter/totalizer readings reported for the system. On this basis, approximately 0.403 million gallons of groundwater were treated during this January 2022 reporting period, at an average effluent flow rate of 9.7 gpm. Based on the approximate 0.403 million gallons treated and total influent concentration of 795.5 ng/L (January 2022 sample results), approximately 0.0012 kilograms of PFAS were estimated to have been removed from the groundwater by GWTS #1 during this reporting period.

The average Effluent flow rates for the reporting period are low compared to typical months; the lower flow rates reflect the reduced effluent pumping rate set at the main transfer pump in response to the leaking of treated water from the above-ground (exterior) cleanout on the Effluent gravity drain. The leaking observed indicated potential pipe damage and back up of flow in the drain. In response, the O&M contractor (GWTT) in consultation with BETA and the County reduced the speed of the transfer pump, thus reducing the treatment system flow rate.

After significant scheduling delays due to a work backlog, a pipe cleaning/jetting contractor was able to visit the Site on January 25, 2022. The contractor conveyed a camera through the effluent piping and determined that there was no visible damage or blockage within the piping. The contractor noted some slight settling along approximately 57 feet of the piping located north of the GWTS#1 building. Although backup was observed within the clean out drainage piping, it did not overflow. As a result, the County, BETA, and GWTT agreed to increase the instantaneous effluent flow rate at GWTS#1 up to approximately 40 gpm on January 25, 2022. GWTT will continue to monitor the system's effluent drainage piping in the event overflow begins again and to determine the cause of the backup or build-up of backpressure.

4.2.2 REMEDIAL MONITORING REPORT – GWPTS #2

GWTS # 2 Monitoring Results

As previously mentioned, BETA collected performance samples from GWTS #2 system on January 25. Samples collected from the Influent (PRW-4), Midpoint, and Effluent ports were submitted to Bureau Veritas for the laboratory analysis of Total PFAS via USEPA Method 537 M. As noted above, recovery well PRW-4 is the source of the Influent groundwater to both groundwater treatment systems. Therefore, the Influent analytical results apply to GWTS #2, as well as GWTS #1.

The attached Table 1B, summarizes the GWTS #2 PFAS analytical data. The complete laboratory report is attached in Appendix B.

As previously mentioned, the tabulated treatment system analytical results from GWTS #2 are reported and compared to the PFAS6 compounds and their respective MCP Method 1 GW-1 Standards. The total sum of the six PFAS concentrations in the Influent sample was 795.5 ng/L (0.796 μ g/L), well above the GW-1 risk standards. Five of the six regulated PFAS compounds were detected at concentrations exceeding the new MCP GW-1 risk standard (0.020 μ g/l or 20 ng/L).

The PFAS6 compounds were detected at concentrations above the laboratory reporting limits in this January 2022 Midpoint sample; four of the PFAS6 compounds, PFOS, PFOA, PFHxS, and PFHpA, were detected at concentrations above the GW-1 risk standard. The sum of the PFAS6 compounds (from this Midpoint sample) was 718.6 ng/L, well above the GW-1 risk standard and indicating PFAS breakthrough of carbon in vessel #1.

The PFAS6 compounds were detected in the Effluent sample above the laboratory reporting limits and well above the applicable GW-1 risk standards (740.8 ng/L), thus indicating that full breakthrough of the carbon had occurred within the system. Upon receipt of these results, BETA informed the system operator to shut down GWTS#2 until a carbon change can be achieved. The results were not received until after the January 2022 reporting period; the shutdown will be discussed in the next status and RMR report for the system. These results are summarized in Table 1B and a copy of the laboratory report is in Appendix B.

GWTS #2 Operational Details

The attached Table 2B summarizes the GWTS #2 performance details. The system was off from January 29 to January 31 (For the January 2022 reporting period) due to loss of power from inclement weather on January 29, 2022. Therefore, the system was operational for approximately 29 days during the January 2022 reporting period.

As described in previous sections, during the normal mode of operation, with the flow from each force main flowing to only one system, it is assumed that roughly 50% of the instantaneous influent rates discussed above for GWTS #1 actually flows to GWTS #2 for treatment. Based on that assumption, for the January 2022 reporting period, the calculated average estimated instantaneous flow rate for GWTS #2 was approximately 24.6 gpm. As noted in the GWTS #1 performance review above, during this reporting period, the instantaneous influent flow rates (total to both systems) remained fairly consistent,

The overall (average) system flow rate and gallons of groundwater treated were based on the Effluent Flow Rate/net totalizer readings reported for the system by the GWTT; approximately 0.379 million gallons of groundwater were estimated to be treated during this reporting period for November 2021, at an approximate Average Effluent Flow Rate of 9.1 gpm. Effluent flow rates and gallons of groundwater treated are considerably lower than expected in comparison to the increase in influent flow rates. As discussed in 4.2.2, the treatment/flow rate of GWTS #1 had to be turned down significantly in response to leaking and backup in the effluent drain. This resulted in GWTS #1 not able to meet the demand of the increased influent flow rates from the pump at PRW-4 (after rehabilitation in November 2021). As a result, the high-level alarm in the GWTS #1 EQ tank is triggered more frequently. This alarm shuts off the pump at PRW-4 that conveys groundwater to both GWTS#1 and GWTS#2. The pump remains off until GWTS #1 can drawdown the volume retained in the EQ tank. During the reporting period, this drawdown took longer than in other periods because of the intentionally reduced treatment rate. This mismatch between influent and effluent flow rates in GWTS #1 and the control system setup also resulted in a significant reduction in influent to and average treatment rate (Effluent Rate) through GWTS #2.

Based on 0.379 million gallons treated, approximately 0.0011 kilograms of PFAS were estimated to have been removed from the groundwater during this reporting period.

4.2.3 REMEDIAL MONITORING REPORT SUMMARY

During the January 2022 reporting period, the two treatment systems, GWTS #1 and GWTS #2, were in operation for all or portions of at least 29 days. The overall (average) system flow rate and gallons of groundwater treated are based on the available Effluent flow totalizer readings for both systems.

For the reporting period from January 1 to January 31, 2022, both systems treated an approximate combined 0.78 million gallons of groundwater from the downgradient recovery well PRW-4 at an average, total (of the two systems) effluent flow rate of 18.73 gpm.

Based on 0.78 million gallons treated, approximately 0.002 kilograms of PFAS were estimated to have been removed from the groundwater during this January 2022 reporting period.

Figure 5 depicts the concentration trends observed in groundwater at the extraction well PRW-4, as measured as the Influent to the groundwater treatment systems. In addition, the Midpoint concentrations for GWTS #1 are graphed. Due to the nature of the laboratory data reported since 2015, this graph depicts the total of the PFOS and PFOA compounds only. Following a spike in concentrations in mid-2019, PFOS and PFOA concentrations have generally decreased or remained relatively stable at PRW-4. The detected concentrations remain elevated relative to the GW-1 risk standards.

4.3 QUARTERLY GROUNDWATER MONITORING

Groundwater monitoring activities related to the documented PFAS Release on Site have been ongoing since November 2013. BETA, formerly Nover-Armstrong Associates, was contracted by Barnstable County to provide LSP and environmental services in April 2018 and has conducted groundwater monitoring activities since June 2018.

In November 2018, BETA proposed a long-term monitoring sampling plan for Site-wide groundwater monitoring on a quarterly and annual basis. Following discussion, MassDEP approved of the sampling plan that included sampling of twelve (12) wells during three quarterly sampling events and sampling an additional eight (8) wells (for a total of twenty (20) during the annual sampling round.

A copy of the plan can be found in previous IRA Status report submittals, including IRA Status Report and RMR No. 35 for the October 2019 reporting period. Additional monitoring points are added to either the quarterly or annual sampling round, as warranted to meet specific objectives or provide additional coverage.

BETA has conducted quarterly groundwater assessments since January 2019 under the approved program. The January 2019 event was selected as the original annual monitoring program for 2019 utilizing the selected 20 monitoring wells. In order to support the design of the proposed groundwater recovery expansion (an IRA Plan Modification), it was decided to move the annual monitoring round up to October 2019, and to add several wells to the sampling program. Since that time, the expanded annual list of monitoring wells has been sampled in October or November.

4.3.1 JANUARY 2022 SITE-WIDE QUARTERLY GROUNDWATER SAMPLING AND ANALYSIS

From January 25 to 26, 2022, BETA conducted a quarterly groundwater monitoring event based on the MassDEP approved sampling plan. A total of 13 monitoring wells were sampled for the laboratory analysis of total PFAS by EPA Method 537 Modified. On those dates the following monitoring wells were sampled: HSW-6, PFW-1, PFW-5, OW-8A, PC-1, PC-6A, PC-11, PC-16d, PC-28, PC-30, PC-38, MW-12S, and MW-22. Figure 2 and Figure 3 depict sampling locations.

Monitoring wells located within the immediate vicinity of the FTA property were gauged prior to sampling. Groundwater gauging data and groundwater elevation data are included in Table 3, appended.

Monitoring wells HSW-6, PFW-1, PFW-5, OW-8A, are located on the FTA property; HSW-6 is located within the former Hot Spot remediation area and PFW-1 is located downgradient of the former Hot Spot remediation area. PFW-5 and OW-8a are located cross-gradient of the Hot Spot area on the FTA property. Monitoring well PC-38 is located approximately 750 feet southeast of the FTA property.

The downgradient monitoring wells (MW-12S, MW-22, PC-1, PC-11, and PC-6A), located between the FTA and the recovery well (PRW-4), were selected based on previous results to evaluate current conditions within the main PFAS plume.

Monitoring wells PC-16d, PC-28, PC-30, are located in the probable downgradient direction from recovery well PRW-4.

The PFAS analytical data for the most recent January 2022 sampling round are included in Table 4A. A copy of the laboratory report/certificate of analysis for the (January 2022) sampling event is included in Appendix B. The laboratory report in Appendix B presents all analytical results for all reported PFAS compounds, including laboratory detection and reporting limits. As previously discussed, effective December 27, 2019, MCP groundwater risk standards for 6 PFAS compounds, (PFOS, PFOA, PFHpA, PFNA, PFHxS, and PFDA) apply to the Site with a GW-1 risk standard of 20 ng/l for the total and/or any single compound. These risk standards are included on Table 4A and Table 4B.

Individual concentrations of (one or more) regulated PFAS6 compounds and Total Concentrations of the PFAS6 detected in the samples from the January 2022 sampling event were above the MCP GW-1 risk standards, except at PC-38. As noted, the results for the additional 17, unregulated PFAS compounds reported by the laboratory are included in the attached laboratory report (Appendix B).

Table 4A and 4B summarizes the sampling dates and PFAS6 concentrations detected during all sampling events at the Site. All previous laboratory reports were included with previously submitted status reports. Overall, PFAS concentrations detected in groundwater during the January 2022 quarterly round of groundwater assessment are similar to historic ranges. Although the total PFAS6 concentrations documented in groundwater are significantly above the current, applicable MCP Method 1 risk standards, concentrations have trended towards a significant decrease in some areas of the Site since PFAS assessment activities started in 2015, especially in the Hot Spot/ Phase 1 cap area. To date, assessment at the Site has revealed PFAS contamination within shallow soils and the immediate vadose zone. Exceptions to the general trend are discussed below.

BETA's review of the January 2022 groundwater data compared to historic sampling events indicate that concentrations of PFAS documented in groundwater within the Disposal Site are primarily decreasing or relatively stable; however, there are some exceptions.

Figures 6 through 9, attached and discussed below, are graphical presentations of total (sum of) PFAS6 concentrations for selected monitoring wells in representative locations across the Disposal Site. It should be noted that the graphs depict discrete periodic sampling events at varying intervals from initial sampling in April 2015 and at quarterly intervals (typically) since January 2019. In addition, due to the range of PFAS concentrations, the graphs have different scales on the vertical axes for PFAS concentrations.

Figure 6 depicts the concentration trends observed in groundwater at monitoring well PFW-1. Since the implementation of the Phase I stormwater improvements during the winter of 2018/2019, which included installing an impermeable cap over the former Hot Spot removal area and adjacent areas and diverting stormwater, PFAS concentrations have generally decreased significantly through mid-to late-2019 and have since remained relatively steady at elevated levels relative to the GW-1 risk standards. A slight increase in concentrations was observed from the July 2021 sampling event to this January 2022 sampling event. This fluctuation appears to be within the range established since July 2020. The recent fluctuation may be due to building demolition and the preparation for the cap in August through October 2021. The former live fire training buildings were demolished in relatively close proximity to PFW-1 and all facility equipment and apparatus were removed from the area that PFW-1 is located in. During construction the area was regraded for the installation of hot mixed asphalt pavement.

Figure 7 depicts the significantly downward trend of PFAS6 concentrations observed in groundwater monitoring well OW-8A, through the October 2020 quarterly sampling event; since October 2020 concentration trends have varied. A noticeable increase in PFAS6 concentrations from the October 2020 to the January 2021 sampling event was observed; subsequently, PFAS6 concentrations in OW-8A were detected at least 700 ppt less than concentrations observed from January 2021 to July 2021. A significant spike in PFAS6 concentrations was detected in the November 3, 2021 sample. Although the cause of these fluctuations is not known, it is BETA's opinion that variable precipitation amounts may be influencing the concentration shifts. Lower concentration amounts may be attributed to lower-than-average precipitation rates. The concentration spikes observed in the November 2021 event may be attributed to significantly increased precipitation that fell from September to October 2021 (before paving was completed) or possibly to disruption related to Site demolition and capping. The PFAS6 concentrations in the January 2022 sample decreased significantly to within the previously observed range, which may be attributed to the completion of the cap in early November 2021.

PFAS concentrations documented in wells MW-12 and MW-22, which are located between the FTA and recovery well PRW-4, have continued to exhibit relatively stable concentration trends. These trends are depicted in Figure 8.

PFAS concentrations documented in wells located farther southeast and downgradient of the FTA, specifically PC-6A, PC-11, PC-28, PC-16D, and PC-30, have long term variable trends. Figures 9A, 9B, 9C and 9D depict PFAS concentration trends in PC-6A, PC-11, PC-28, and PC-30 respectively.

PC-6A (Fig 9A) shows variable concentrations; however, concentrations observed since the spring of 2019 have been relatively stable with a relative decreasing trend.

As depicted on Figure 9B, groundwater concentrations at PC-11 have been relatively stable since the significantly decreasing after October 2020.

Groundwater concentrations at PC-28 are depicted on Figure 9C; concentrations were significantly higher in October 2020 and January 2021 than previously detected. Since July 2021, detected PFAS6 concentrations have been trending around 1,000 ng/l. However, PFAS6 concentrations were significantly lower in the November 2021 sample.

As shown on Figure 9D, since February 2020, PFAS6 concentrations at PC-30 have exhibited an overall decreasing trend.

Monitoring well PC-38, the furthest south-southeast location sampled during this quarterly monitoring event, did not exhibit PFAS6 concentrations above the laboratory reporting limits. Groundwater sampled from PC-38 since April 2017 has only had a few detectable concentrations of PFAS6 documented.

Utilizing the total sum of the six regulated PFAS compounds, concentration data were interpolated to depict an approximate concentration plume map based on the January 2022 monitoring results. Figure 10 depicts the concentration plume for the January 2022 monitoring results; the highest concentrations within the PFAS contaminant plume appear to be concentrated south and east and within approximately 200 feet of the FTA and in the vicinity of PRW-4. The lowest concentrations (below the Method 1 GW-1 standards) are on the outer northeastern and southeastern edges of the plume.

4.3.2 SITE-WIDE GROUNDWATER GAUGING AND ELEVATION SURVEY

BETA gauged depth to groundwater in the monitoring wells located on and within 100 feet of the FTA and in selected monitoring wells east and southeast of the FTA on January 25, 2022. Table 3 presents a tabulated summary of the seasonal groundwater elevation data (from 2018-2022) for selected monitoring points across the Disposal Site.

Groundwater flow has historically been inferred to be to the south-southeasterly from the former FTA. Refer to Figure 11 for a depiction of the calculated groundwater elevation contours from the January 2022 gauging event. This 2022 data indicate a continuation of the historic pattern near the FTA but a more easterly flow pattern away from the facility. The gauging results indicate moderate influence from the operating recovery well, PRW-4. Groundwater elevations near and across the power line easement exhibit an erratic pattern; the cause or causes of this pattern are unknown.

5.0 SITE WIDE CAPPING AND SELECT BUILDING DEMOLITION

In response to a directive from MassDEP, an IRA Plan Modification was finalized in December 2019 and design plans for Sitewide capping were submitted for approval to the Town of Barnstable via a Notice of Intent in February 2020. Final design approval and an Order of Conditions was obtained in November 2020 and January 2021 respectively. IRA Plan Modification No. 3 was also finalized in June 2021 to include selected building demolition into the project. The County received bids for the project in April 2021. The capping project was awarded in July 2021.

Construction began in August 2021 and was substantially completed in October 2021. The former live fire training buildings and other fire training props and features were demolished and removed from Site. Approximately 650 tons of PFAS contaminated demolition debris and materials associated with these structures were transported to and disposed of at the US Ecology / Wayne Disposal, Inc. disposal facility in Belleville, MI in September 2021. Approximately 59,000 square feet (SF) of unpaved portions of the FTA were capped with 3.5-inches of hot mix asphalt pavement following installation of a stormwater management system and regrading of the facility. Additional details, photographic documentation of the completed cap, and waste disposal documentation were provided in IRA Status Report No. 60 for the November 2021 reporting period.

6.0 IRA EVALUATION

In accordance with the MCP, this section presents evaluations of potential IRA conditions at the Site.

6.1 ASSESSMENT FOR SUBSTANTIAL RELEASE MIGRATION (SRM)

Due to the documentation that PFAS has most likely migrated more than 200 feet downgradient and has been detected in a public water supply well and surface water body, the Site meets the criteria for a Condition of Substantial Release Migration (SRM), as defined by 310 CMR 40.0006.

6.2 IDENTIFICATION OF CRITICAL EXPOSURE PATHWAYS (CEP)

No Critical Exposure Pathways, as defined by 310 CMR 40.0006, currently exist at the Disposal Site.

6.3 IMMINENT HAZARD (IH) EVALUATION

Based on the concentrations of PFOS exceeding the USEPA HA level in the Mary Dunn wells in 2013, the Cape Cod Commission identified the presence of an Imminent Hazard (IH) condition pursuant to 310 CMR 40.0321(2)(c).

The GAC treatment of the Mary Dunn Wells has been assumed to be actively preventing a potential Imminent Hazard to the Hyannis community by removing the PFAS compounds from the water supply.

The Mary Dunn wells are monitored on a regular basis by the Hyannis Water Department to ensure that exposure to humans is less than the USEPA HA, the MassDEP Drinking Water Standards effective on December 27, 2019 and the finalized MassDEP MCL (MMCL) standard. MassDEP finalized the MMCLs for PFAS in January 2021; the final MCL for PFAS in drinking water is 20 ng/l and applies to the 6 regulated PFAS compounds.

6.4 ASSESSMENT OF NEED FOR IMMEDIATE RESPONSE ACTIONS (IRA)

The operation of the on-Site groundwater pumping and treatment system to reduce PFAS concentrations downgradient of the FTA will continue as an IRA. Continuation of assessment IRAs is warranted; specifically, periodic monitoring of groundwater at the Site and monitoring the PFAS treatment of the output of the Hyannis Water District/Town of Barnstable operated Mary Dunn Wells.

However, Site-wide assessment will also be proceeding under the Phase II Comprehensive Site Assessment (CSA) Scope of Work (SOW); the SOW was submitted for public comment. The County and BETA are in the process of finalizing the Phase II CSA SOW. Additional technologies to treat / remove PFAS from soil and groundwater at the FTA will be evaluated as part of the MCP Phase III evaluation of remedial alternatives.

In addition, planned expansion of groundwater extraction and treatment, as mandated by MassDEP, was described conceptually in the final December 2019 IRA Plan Modification. The final design and implementation of that component of the IRA Plan Modification is being re-evaluated in terms of feasibility of implementation as an IRA and potential overlap and duplication with MCP Phase III and Phase IV (remedy implementation) work to be conducted immediately following the completion of the Phase II CSA.

7.0 PUBLIC NOTIFICATIONS

Copies of public notification letters regarding the proposed IRA activities sent to officials of the Town of Barnstable in accordance with MCP 310 CMR 40.1403(3) (a) requirements are included as Appendix C. Per the Final PIP, email and written notifications regarding the submittal of this IRA Plan Modification to MassDEP and the availability of the Plan at the Site repository will be sent to those listed on the PIP Mailing List.

As previously mentioned, MassDEP communicated to the County and BETA that based on the current project status, monthly submissions of IRA status and remedial monitoring reports (RMR) would no longer be required. Upon further discussion with MassDEP, it was established that a six-month submittal schedule for IRA Status and RMR reports will be acceptable. This IRA Status RMR-No. 62 for the January 2022 reporting period will be the first report submission within this new schedule.

However, quarterly updates regarding clean up and remediation activities of the PFAS release at the Site will be provided to the public, more specifically those listed on the Public Involvement mailing list. These updates will be in the form of written notices and/or public meetings.

Written correspondence will be sent to those listed on the PI Mailing List notifying them of the submission of this IRA Status report and availability of this report for review.

795.5

Notes: 795.5

1. Concentrations presented in ng/L - nanograms per Liter - parts per trillion
2 * - Prior to June 11, 2018, the USEPA established the EPA Health Advisory for two PFAS chemicals, PFOA and PFOS, which was 70 ng/L. Subsequently, MassDEP's Office of Research and Standards (ORS) expanded on this Health Advisory and created the ORS Guideline that applied to the total summed of five PFAS chemicals, PFOA, PFNA, PFNA

PFNA - Perfluorooctanoic Acid
 PFNA - Perfluorononanoic Acid
 PFNA - Perfluorononanoic Acid
 PFHxS - Perfluorohexanesulfonic Acid

PFHpA - Perfluoroheptanoic Acid
 PFDA - Perfluorodecanoic Acid
 NA - Concentration data not available

Table 2A - Summarv of Groundwater Pump and Treatment Sistem Operating and Maintenance Data - Sistem No. 1 (GWTS #1) Barnstable County Fire and Resous Training Academy 155 Fire Rock Road. Barnstable. MA RRIN 4:26179

Notes:

- 1. Concentrations presented in ng/L nanograms per Liter parts per trillion
- 2. MassDEP's Office of Research and Standards (ORS) expanded upon the USEPA's Health Advisory and created the ORS Guideline that applies to the total summed of five PFAS chemicals, PFOS, PFOA, PFNA, PFNA, PFHAS, and PFHpA, effective June 11, 2018.
- 3. Concentrations of the PFAS compound, PFDA, are presented based on the April 19, 2019, MassDEP draft of new/proposed groundwater standards for PFAS that includes a sixth, PFAS compound, PFDA. However the concentration of PFDA is not include in total PFAS removal calcuations.
- 5. BRL Below Laboratory Reporting Limits; reporting limit shown in parentheses.
- 6. Concentrations in bold exceed applicable MassDEP ORS Guideline
- 7. PFOS Perfluorooctanesulfonic acid
- 8. PFOA Perfluorooctanoic Acid
- 9. PFNA Perfluorononanoic Acid
- 10. PFHxS Perfluorohexanesulfonic Acid
- 11. PFHpA Perfluoroheptanoic Acid
- 12. PFDA Perfluorodecanoic Acid
- 13. --: Concentration data not available and/or sample was not collected on that date.
- 14. Per MCP Regulations, the system was sampled one day, three days, and seven (7) days following the initial week of startup (11/11/19).
- 15. On December 13, 2019, MassDEP published the newly established clean up standards for PFAS in soil and groundwater. These standards were effective as of December 27, 2019 and apply to the total sum of six PFAS chemicals, PFOS, PFOA, PFNA, PFHAS, PFHpA, and PFDA. Concentrations of the six PFAS compounds presented in the table were not compared to the new MassDEP standards until the January 2020 monthly system sample collection.
- 16. The December monthly sample was collected from the system's effluent stream on 12/17/2019 following the receipt of the laboratory results from the 11/19/2019 sampling event on 12/16/2019.
- The effluent was resampled again to ensure significant breakthrough was not occurring from the secondary carbon vessel.

Notes:

1. GWTT - Groundwater Treatment Technologies

2. Pressure readings before filter bag changeout or if no changeout was done.

3. Influent flow is an instantaneous estimate of the flow rate from the submersible Well Pump at PRW-4.

4. During monthly reporting periods the net gallons are calculated from previous effluent totalizer readings. (Difference between the current totalizer reading. the last dated totalizer reading.

5. The Average effluent flow rate is calculated from the net gallons obtained from the system's effluent totalizer flow meter and days that the system was in operation.

6. The "Totals" shown (from left to right) include the Notal Days of System (translater) entral proximal proximation are instantaneous filters flow rate is a resistented by approximating 50% of the influent flow rate values calculated from GWPTs #1 (See Table 2A).

7. Instantaneous effluent flow rates are estimated by approximating 50% of the influent flow rate values calculated from GWPTs #1 (See Table 2A).

8. Instantaneous effluent flow rates destinated by support that a totalizer meter.

9. Flow calculated based on gallons marking on EO tank. Estimated flow rate - 25 GPM (i.e. flow is calculated based on an in-situ observation of flow into the EO tank, and 100 gallons of groundwater flows into the EO tank for a 4 minute duration.

10. The monthly totals represent the monthly IRA reporting period and the average effluent flow rates calculated from the first monitoring date are based on measurements from the last monitoring date of the previous reporting period.

- Notes:
 1. ---: Indicates monitoring well has not been surveyed and/or is not gauged regularly.
 2. DG: Downgradient
 3. All monitoring wells located on the Academy property were surveyed in 2018.
 4. Monitoring wells located off Academy property were surveyed in 2007 by Cape Cod Commission.
 5. Pond Gauge was installed in April 2019.
 6. NS- Not Surveyed; unable to locate, not deemed a viable well.
 7. NA- Not Available; survey data is unavailable as it's being re-evaluated.
 8. Well IDs and Location displayed in gray indicate the well has been abandoned or destroyed.
 9. The Pond Edge elevation was collected during a simple survey on 7/27/2020 of Flintrock Pond water's edge. Monitoring well PFW-4 was utilized as a benchmark.
 10. Well IDs in Gray font are considered destroyed and/or not viable for sampling.

- Notes:

 1. --: Indicates monitoring well has not been surveyed and/or is not gauged regularly.

 2. DG: Downgradient

 3. All monitoring wells located on the Academy property were surveyed in 2018.

 4. Monitoring wells located off Academy property were surveyed in 2007 by Cape Cod Commission.

 5. Pond Gauge was installed in April 2019.

 6. NS- Not Surveyed; unable to locate, not deemed a viable well.

 7. NA- Not Available; survey data is unavailable as it's being re-evaluated.

 8. Well IDs and Location displayed in gray indicate the well has been abandoned or destroyed.

 9. The Pond Edge elevation was collected during a simple survey on 7/27/2020 of Flintrock Pond water's edge. Monitoring well PFW-4 was utilized as a benchmark.

 10. Well IDs in Gray font are considered destroyed and/or not viable for sampling.

- 1. Prior to June 11, 2018, the USEPA established the EPA Health Advisory for two PFAS chemicals, PFOA and PFOS, which was 70 ng/L. Subsequently, MassDEP's Office of Research and Standards (ORS) expanded on this Health Advisory and created the ORS Guideline that applies to the total summed of five PFAS chemicals, PFOA, PFNA, PFHXS, and PFHpA, effective June 11, 2018.
- 2. The USEPA and MassDEP ORS Guideline applies to five PFAS chemicals of concern (PFOS, PFOA, PFNA, PFHPA, and PFHxS) individually as well as the sum of the five PFAS of concern.
- 3. The complete PFAS concentration data set collected from PRW-4 is detailed in the data table titled "Summary of Groundwater Pump and Treatment System PFOS/PFOA Analytical Data. Data presented herein is summarized and data was selected based on quarterly sampling events.
- 4. (--) Concentrations of the three additional PFAS chemicals, PFNA, PFHAS, and PFHpA were not presented until after the MassDEP or Guideline was in effect on 06. 11.18. PFAS concentrations were regulated by the USEPAHealth Advisory prior to 6. 11.18. Concentrations of PFDA were not presented prior to April 19, 2019. MassDEP released drafted Method 1 groundwater risk standards for PFAS on April 19, 2019 that applies to the total sum and individual concentrations of six PFAS compounds (PFOS, PFOA, PFNA, PFHAS, PFHPA, and PFDA), which is 20 ng/L. These drafted groundwater standards were finalized and became effective on December 27, 2019.
- 5. BRL Below Laboratory Detection Limits
- 6. Concentrations presented in ng/L nanograms per Liter parts per trillion
- 7. Concentrations in bold exceed applicable Health Advisory Limit or Method 1 GW-1 Standard

1. Prior to June 11, 2018, the USEPA established the EPA Health Advisory for two PFAS chemicals, PFOA and PFOS, which was 70 ng/L. Subsequently, MassDEP's Office of Research and Standards (ORS) expanded on this Health Advisory and created the ORS Guideline that applies to the total summed of five PFAS chemicals, PFOA, PFOA, PFNA, PFHxS, and PFHpA, effective June 11, 2018.

- 2. The USEPA and MassDEP ORS Guideline applies to five PFAS chemicals of concern (PFOS, PFOA, PFNA, PFHPA, and PFHxS) individually as well as the sum of the five PFAS of concern.
- 3. The complete PFAS concentration data set collected from PRW-4 is detailed in the data table titled "Summary of Groundwater Pump and Treatment System PFOS/PFOA Analytical Data. Data presented herein is summarized and data was selected based on quarterly sampling events.
- 4. (--) Concentrations of the three additional PFAS chemicals, PFNA, PFHAS, and PFHpA were not presented until after the MassDEP ORS Guideline was in effect on 06. 11.18. PFAS concentrations were regulated by the USEPA Health Advisory prior to 6. 11.18. Concentrations of PFDA were not presented prior to April 19, 2019. MassDEP released drafted Method 1 groundwater risk standards for PFAS on April 19, 2019 that applies to the total sum and individual concentrations of six PFAS compounds (PFOS, PFOA, PFNAS, PFHAS, and PFDA), which is 20 ng/L. These drafted groundwater standards were finalized and became effective on December 27, 2019.

1. Prior to June 11, 2018, the USEPA established the EPA Health Advisory for two PFAS chemicals, PFOA and PFOS, which was 70 ng/L. Subsequently, MassDEP's Office of Research and Standards (ORS) expanded on this Health Advisory and created the ORS Guideline that applies to the total summed of five PFAS chemicals, PFOA, PFNA, PFNA, PFNA, PFNA, and PFHpA, effective June 11, 2018.

- 2. The USEPA and MassDEP ORS Guideline applies to five PFAS chemicals of concern (PFOS, PFOA, PFNA, PFHpA, and PFHxS) individually as well as the sum of the five PFAS of concern.
- 3. The complete PFAS concentration data set collected from PRW-4 is detailed in the data table titled "Summary of Groundwater Pump and Treatment System PFOS/PFOA Analytical Data. Data presented herein is summarized and data was selected based on quarterly sampling events.
- 4. (--) Concentrations of the three additional PFAS chemicals, PFNA, PFNA, PFNA, PFNAS, and PFHpA were not presented until after the MassDEP released drafted Method 1 groundwater risk standards for PFAS on April 19, 2019 that applies to the total sum and individual concentrations of six PFAS compounds (PFOS, PFOA, PFNAS, PFHpA, and PFDA), which is 20 ng/L. These drafted groundwater standards were finalized and became effective on December 27, 2019.
- 5. BRL Below Laboratory Detection Limits
- 6. Concentrations presented in ng/L nanograms per Liter parts per trillion
- 7. Concentrations in bold exceed applicable Health Advisory Limit or Method 1 GW-1 Standard
- 8. PFOS Perfluorooctanesulfonate
- 9. PFOA Perfluorooctanoic Acid
- 10. PFNA Perfluorononanoic Acid
- 11. PFHxS Perfluorohexanesulfonic Acid
- 12. PFHpA Perfluoroheptanoic Acid13. PFDA Perfluorodecanoic Acid
- 14. NA- Concentration data not available
- 15. Monitoring well HS-1, HS-2, HS-2S, and HS-6 were destroyed or removed during soil removal activities in January 2017 as part of an Immediate Response Action Plan. The well was replaced with HSW-1/HS-1a as post-exacavation activities.
- 16. Monitoring well HW-1D is a downgradient well located on the north side of Mary Dunn Pond.
- 17. NE- Not Established

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

- * RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
- (1) Per- and polyfluoroalkyl substances (PFAS) identified as surrogates on the certificate of analysis represent the extracted internal standard.

QC Batch = Quality Control Batch

N/A = Not Applicable

(1) Extracted internal standard analyte recovery was below the defined lower control limit (LCL). Laboratory spiked water resulted in satisfactory recovery of the extracted internal standard analyte. When considered together, these QC data suggest that matrix interferences may be increasing the variability of the associated native analyte result (PFTeDA, PFTrDA).

GENERAL COMMENTS

Sample RSM909 [DUPLICATE]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, a reduced sample volume was extracted and analyzed. Detection limits were adjusted accordingly.

Sample RSM910 [PFW-1]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, a reduced sample volume was extracted and analyzed. Detection limits were adjusted accordingly.

Sample RSM911 [PFW-5]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, a reduced sample volume was extracted and analyzed. Detection limits were adjusted accordingly.

Sample RSM912 [HSW-6]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, a reduced sample volume was extracted and analyzed. Detection limits were adjusted accordingly.

Sample RSM914 [MW-12S]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, a reduced sample volume was extracted and analyzed. Detection limits were adjusted accordingly.

Sample RSM942 [PC-11]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, a reduced sample volume was extracted and analyzed. Detection limits were adjusted accordingly.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

QA/QC								
Batch	Init	QC Type	Parameter	Date Analyzed	Value	% Recovery	UNITS	QC Limits
			8:2 Fluorotelomer sulfonic acid	2022/02/07	<0.0067		ug/L	

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

Site Location: BARNSTABLE, MA

Sampler Initials: MM

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by:

Colm McNamara, Senior Analyst, Liquid Chromatography

Bureau Veritas has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

- * RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
- (1) Per- and polyfluoroalkyl substances (PFAS) identified as surrogates on the certificate of analysis represent the extracted internal standard.

⁽¹⁾ Extracted internal standard analyte recovery was below the defined lower control limit (LCL). Laboratory spiked water resulted in satisfactory recovery of the extracted internal standard analyte. When considered together, these QC data suggest that matrix interferences may be increasing the variability of the associated native analyte result (PFDoA).

⁽²⁾ Extracted internal standard analyte recovery was below the defined lower control limit (LCL). Laboratory spiked water resulted in satisfactory recovery of the extracted internal standard analyte. When considered together, these QC data suggest that matrix interferences may be increasing the variability of the associated native analyte results (PFTrDA, PFTeDA).

GENERAL COMMENTS

Sample RSM962 [INFLUENT (PRW-4)]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, sample required dilution. Detection limits were adjusted accordingly.

Sample RSM963 [SYSTEM#1 MIDPOINT]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, sample required dilution. Detection limits were adjusted accordingly.

Sample RSM965 [SYSTEM#2 MIDPOINT]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, sample required dilution. Detection limits were adjusted accordingly.

Sample RSM966 [SYSTEM#2 EFFLUENT]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, sample required dilution. Detection limits were adjusted accordingly.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

RE: Immediate Response Action Status and Remedial Monitoring Report #62

The Former Barnstable County Fire and Rescue Training Academy

155 South Flint Rock Road Barnstable, Massachusetts

DEP Release Tracking No. 4-26179

Project File #6206

Dear Mr. Ells,

As required by the Massachusetts Contingency Plan (MCP) 310 CMR 40.1403(3)(e) and 40.1403(6), BETA Group, Inc.(BETA) is notifying you on behalf of our client, Barnstable County, that an Immediate Response Action (IRA) Status and Remedial Monitoring Report (RMR) No. 62 is being submitted to the Massachusetts Department of Environmental Protection – Bureau of Waste Site Cleanup (MassDEP – BWSC) for the release site referenced as the former Barnstable County Fire and Rescue Training Academy (BCFRTA) located at 155 South Flint Rock Road in Barnstable, Massachusetts (the site). This Report summarizes the IRA activities that occurred during the January 2022 monthly reporting period.

Pursuant to the Massachusetts Contingency Plan (310 CMR 40.0480), an Initial Site Investigation has been performed at the site. A release of oils and/or hazardous materials has occurred at the site. In August 2016, MassDEP Southeast Regional Office issued a Notice of Responsibility (NOR) to Barnstable County, as current owner and operator of the Barnstable County Fire and Rescue Training Academy (BCFRTA), that the detection of elevated concentrations of poly- and perfluoroalkyl substances (PFAS) in groundwater at the site constituted a release under the MCP. MassDEP issued Release Tracking Number (RTN) 4-26179 to this release. As summarized in the NOR, based on the detected PFAS concentrations in soil and groundwater at the BCFRTA and the inferred groundwater flow, MassDEP determined that the releases of PFAS from the use of aqueous film-forming foam (AFFF) at the BCFRTA is a source of PFAS detected in the Mary Dunn public water supply wells.

During the January 2022 reporting period, the treatment systems, GWTS #1 and GWTS#2 were in operation for all, or portions of approximately 29 days.

The overall (average) system flow rate and gallons of groundwater treated are based on the available Effluent flow totalizer readings reported by the O&M contractor. For the January 2022 reporting period GWTS#1 and GWTS#2 treated an approximate combined 0.78 million gallons of groundwater from the downgradient recovery well PRW-4 at an average, total combined effluent flow rate of 18.73 gpm. The average combined influent flow rate was measured to be 49.2 gpm.

Based on the total of 0.78 million gallons treated, approximately 0.002 kilograms of PFAS were estimated to have been removed from the plume area.

The IRA Status and RMR document is available electronically via the searchable sites database of the MassGOV / MassDEP website via the following link:

https://eeaonline.eea.state.ma.us/portal#!/wastesite/4-0026179

At this time, IRA activities are ongoing. Continuing IRA activities will include operation and monitoring of the on--Site Groundwater Pump and Treatment Systems (GWPTS), including performance sampling of GWPTS, review and evaluation of the on-Site GWPTS operation and maintenance activities as they affect groundwater treatment, periodic groundwater monitoring. Additional details regarding the continuing IRA activities are included in the IRA Status and RMR No. 62 report document.

Change in Procedure for Filing Status Reports

In December 2021, MassDEP communicated to the County and BETA that based on the current project status, monthly submissions of IRA status and remedial monitoring reports (RMR) would no longer be required. Upon further discussion with MassDEP in January 2022, it was established that a six-month submittal schedule for IRA Status and RMR reports will be acceptable. The first report submission within this new schedule is this IRA Status and RMR No. 62 document.

However, quarterly updates regarding clean up and remediation activities of the PFAS release at the Site will be provided to the public, more specifically those listed on the Public Involvement mailing list. These updates will be in the form of written notices and/or public meetings.

If you have any questions or comments, please do not hesitate to contact our office.

Sincerely,

BETA Group, Inc.

P. Mulo
