1.0 INTRODUCTION

BETA Group Inc. (BETA) has prepared this Immediate Response Action (IRA) Status and Remedial Monitoring Report (RMR) No. 54 that addresses a release of hazardous materials related to fire-fighting foams and attributed to the Barnstable County Fire and Rescue Training facility located at 155 South Flint Rock Road in Barnstable, Massachusetts (the FTA or facility). This document has been prepared and is being submitted to the Massachusetts Department of Environmental Protection (MassDEP) – Bureau of Waste Site Cleanup (BWSC) in response to the detection of elevated concentrations of per- and polyfluoroalkyl substances (PFAS), including perfluorooctane sulfonate (PFOS) and perfluorooctanoic acid (PFOA), in soil and groundwater at the facility and in adjacent areas, in particular to the east, southeast of the facility. This report provides monthly IRA status reporting on the groundwater pumping and treatment system at the Site for the month of May 2021. In addition, this status report describes the activities and results of the Site-wide groundwater monitoring in May 2021.

This (IRA) Status and Remedial Monitoring Report (RMR) No. 54 is being submitted to MassDEP as an attachment to the BWSC 105 Immediate Response Action (IRA) and BWSC 105A and 105B IRA Remedial Monitoring Report Transmittal Forms. Completed copies of these forms prior to electronic signature are included in Appendix A.

As current owners of the FTA, Barnstable County, as represented by the Barnstable County Commissioners, have been named as the Potentially Responsible Party (PRP) for this release. The contact person for the Disposal Site and release is:

Steve Tebo, Asset and Infrastructure Manager Telephone: 508-375-6643
Barnstable County Email: stebo@barnstablecounty.org

3195 Main Street Barnstable, MA 02630

BETA is performing MCP Response Actions on behalf of the Barnstable County Commissioners. The Licensed Site Professional (LSP) overseeing Response Actions for this release is:

Roger Thibault, P.E., LSP No. 1443

Telephone: 401-333-2382
BETA Group Inc.

Email: rthibault@beta-inc.com

701 George Washington Highway

2.0 GENERAL DISPOSAL SITE INFORMATION

2.1 PROPERTY AND SITE DESCRIPTION

The Barnstable County Fire and Rescue Training FTA (FTA or facility) is located on South Flint Rock Road in the Town of Barnstable. It appears on the United States Geological Survey (USGS) Topographic Quadrangle – Hyannis, Massachusetts -Figure 1 – Site Location map, prepared from a portion of the referenced USGS Topographic Quadrangle map. The Site is currently zoned for industrial use.

For the purposes of this and future MCP submittals, the property on which the Barnstable County Fire and Rescue Training FTA is located will be referred to as the FTA or facility. FTA or facility will also refer to the structures, land and functions of the FTA.

In accordance with the MCP definitions, where contamination attributable to the PFAS releases associated with firefighting foams and training on the FTA have come to be located will be referred to as the Disposal Site or Site.

The 6.2 acre FTA is improved by three primary buildings: an auxiliary fire station and training building (with two classrooms, administrative offices, and two apparatus bays), a classroom building, and a burn building (for live fire suppression training), along with several sheds and outbuildings used for fire and rescue training activities. Recently, a wood framed house-like structure formerly used for smoke training was demolished. Refer to Figure 2. The FTA is secured by chain link fencing and a locked gate. The FTA is listed on the Town of Barnstable Assessor's on-line records as Map 313, Lot 007. The current owner-of-record is the County of Barnstable, who acquired the facility from the Town of Barnstable in 1983 by deed recorded June 3, 1983, Barnstable Registry of Deeds, Book 3759, Page 39. Utilities servicing the FTA include municipal water, a private underground septic system, aboveground electricity and telecommunications.

The FTA was first constructed on land donated to the Town of Barnstable by the Cobb Trust in 1955. The FTA had been used for public safety training since the 1950's. The FTA had been used for public safety training by fire departments and fire districts from throughout Barnstable County, fire departments outside of Barnstable County, and other public and private institutions. Live fire training using firefighting foams, including aqueous film forming foams (AFFF), was conducted at the FTA for decades by fire districts and departments that used their own foam brought to the FTA in the apparatus of the organization participating in the training. Foam training exercises at the FTA ceased in 2009 according to FTA officials. Water training activities ceased in June 2019. Currently, the FTA periodically hosts classroom training sessions.

Land surrounding the FTA is primarily undeveloped, wooded land within a public water supply protection area. Flintrock Pond occupies approximately 6 acres directly to the west of the FTA. Several public water supply wells and their related facilities are located to the east, southeast, and west of the FTA.

At this time, the preliminary MCP Disposal Site (the Site) associated with RTN 4-26179 is considered to comprise approximately the majority of the FTA, the westerly adjacent Flintrock Pond, and a large woodland area to the southeast of the FTA, approaching Mary Dunn Pond.

The southeastern portion of the Site includes land owned by the Town of Barnstable, which is crossed by two electric power transmission lines running presumably within easements. Private industrial properties and related structures are located approximately 500 to 1,000 feet south of the Site. The Barnstable Municipal Airport is located to the west (runway 15 – 33) and south of the Site and the FTA.

The nearest residential properties are located approximately ¼ mile to the north of the Site. Based on 2010 U.S. Census data, the residential population located within a ½ mile radius of the Site is estimated to be less than 150 people. There are no known Institutions located within 500 feet of the Site. The FTA currently has approximately 2 to 5 workers who may be considered full-time. During training activities, which now is restricted to classroom training activities only, 20 to 30 fire fighters or rescue personnel and training personnel may temporarily use the facility. The municipal well pumping facilities are not staffed full-time.

2.2 LATITUDE AND LONGITUDE / UNIVERSAL TRANSVERSE MERCATOR'S

The coordinates for the Site are shown below. For simplicity, these coordinates are for the southerly end of the FTA.

<u>Latitude/Longitude</u> Latitude: 41° 40′ 41.53″

Longitude: 70° 17′ 7.82″

<u>UTM Coordinates</u> Easting: 393,002

Northing: 4,614,847

2.3 ENVIRONMENTAL SETTING AND SENSITIVE RECEPTORS

BETA's review of the Massachusetts GIS Priority Resources (21E) mapping (Figure 4) revealed that the Site is located within a Zone II Public Water Supply Protection Area and a Medium-Yield Sole Source Aquifer. The FTA is situated to the west and most likely upgradient of the Mary Dunn public water supply wells 1, 2, and 3 under pumping conditions. Mary Dunn Wells 1, 2, and 3 are located within the preliminary Disposal Site boundary at this time due to the detections of PFAS in the groundwater at those wells. There are no known private potable water wells located within 500 feet of the Site.

Mary Dunn Well 3 (MD-3), which is the nearest public water supply well to the facility, has been documented to pump at an average rate of 380 to 450 gallons per minute (gpm). Mary Dunn Wells 1 and 2 (MD-1 and MD-2) are located approximately 1600 feet and 1800 feet, respectively, southwest of the FTA. These wells have been reported to have been pumped at rates of 400 gpm, each. Airport Well 1, is also periodically used according to MassDEP Drinking Water Program; it is located further to the southeast of the Site, south of Mary Dunn Pond. Two other public water supply wells, identified as the Barnstable Fire District (BFD) wells BFD-2 and BFD-5, are located to the west and most likely upgradient of the Site. The BFD wells are not operated by or part of the Hyannis Water System (as are the Mary Dunn public water supply wells).

According to the USGS Topographic Quadrangle – Hyannis, Massachusetts, elevations at the Site are approximately 30 to 50 feet above mean sea level (MSL). Topography of the Site can be categorized as generally flat with slight to moderate slopes downward to the west and southeast, toward Flintrock Pond and Mary Dunn Pond, respectively.

The nearest surface water bodies to the Site are Flintrock Pond and an unnamed Pond; Flintrock Pond is located west adjacent to the FTA and the unnamed Pond is located northeast adjacent to the FTA (as depicted in Figures 2 and 3). A portion of Flintrock Pond is located within the preliminary MCP Disposal Site Boundary based on the detection of PFAS in sediment and surface water. There are no streams or wetlands located at the Site.

2.4 MASSDEP METHOD 1 CATEGORIES

2.4.1 GROUND WATER CATEGORY

As noted, the Site is located within a Zone II Public Water Supply Protection Area and a Medium-Yield Sole Source Aquifer.

Therefore, MCP Method 1 Ground Water Category 1 (GW-1) applies to the Site. Groundwater at the Site is also categorized as Method 1 GW-2 because groundwater has been measured at depths less than 15 feet below grade and an occupied building is located within the FTA facility.

All ground waters within the Commonwealth are considered a potential source of discharge to surface waters and shall be categorized, at a minimum, as Method 1 GW-3. Therefore, the applicable Method 1 Ground Water Categories for the Site are GW-1, GW-2 and GW-3.

2.4.2 SOIL CATEGORY

Soil categorization is based upon the type of human receptor and three potential exposure criteria: frequency of use, intensity of use, and accessibility of soil. The FTA portion of the Site is occupied by a fire and rescue training facility. Based on the nature of the facility, children are assumed to be "not present." Adults who work at the site as staff members are assumed to be present at "high frequency." Impacted soils have been identified beneath unpaved areas at depths ranging from approximately less than 3 to 15 feet below the ground surface. Therefore, impacted soils at the FTA are considered "potentially accessible."

Only groundwater impacts at significant depths below the ground surface have been identified at the remainder of the Site (outside of the FTA), which consists of undeveloped, industrially zoned land, a portion of a utility easement, and three unmanned public water supply well stations.

Intensity of use in regard to soil disturbance in the release area for adults at the Site is considered "high" because the area of impact at the FTA could potentially be disturbed during firefighting / rescue training activities; however, on-Site training activities involve a relatively short duration of high intensity use. Therefore, for current Site uses, soils at the Site are categorized as Soil Category S-2. The applicable Soil Categories for current Site uses have been identified as S-2/GW-1, S-2/GW-2 and S-2/GW-3.

The applicable Soil Categories for unrestricted future Site uses are S-1/GW-1, S-1/GW-2 and S-1/GW-3.

3.0 DISPOSAL SITE HISTORY AND OVERVIEW

The Site has historically been the subject of four MassDEP RTNs: 4-190, 4-11707, 4-20021, and 4-26179. This IRA Plan Modification is being submitted for RTN 4-26179 only. The original RTN, 4-190, is being managed separately; closure has been achieved for the remaining two RTNs.

3.1 RELEASE HISTORY AND DESCRIPTION - RTN 4-26179 (PFAS RELEASE)

In May 2012, USEPA issued their final rule "Revisions to the Unregulated Contaminant Monitoring Rule (UCMR3) for Public Water Systems," which was a national sampling mandate for "emerging contaminants" in public water supplies. The required sampling list included several PFAS compounds, including but not limited to PFOS and PFOA. In November 2013, samples were collected from Mary Dunn supply wells MD-1, MD-2 and MD-3 and analyzed for PFAS.

At the time of the testing, the US EPA Provisional Health Advisory (HA) was 0.20 micrograms per liter (μ g/L) for PFOS. Analytical results revealed evidence of PFOS contamination in all three wells sampled. MD-1 and MD-2 were temporarily removed from service. MD-3 was apparently not in use at that time. A treatment system that utilizes granular activated carbon (GAC) was later implemented for MD-1 and MD-2 [July 2015] by the Hyannis Water Department. In 2016, GAC treatment was also implemented for MD-3. [See below].

In November 2013, Barnstable County personnel also collected soil and groundwater samples from the FTA property, located approximately 1,000 feet west of the Mary Dunn wells, and submitted them for laboratory analysis of PFAS. Groundwater analytical results revealed that FTA groundwater was impacted by PFOS and MassDEP was subsequently notified.

PFOS was also detected in soil at the FTA and in surface water and sediment within the adjacent Flintrock Pond. As summarized in the Notice of Responsibility (NOR) issued by MassDEP on August 4, 2016 (see below), based on the detected PFAS concentrations in soil and groundwater at the FTA and the inferred groundwater flow direction being to the southeast (toward the Mary Dunn wells), MassDEP determined that the releases of PFAS from the use of AFFF at the FTA is a source of PFAS detected in the Mary Dunn wells.

As a voluntary measure, Barnstable County refurbished the former perchlorate pump and treat system located at the FTA to help remediate and contain the PFOS apparently migrating from the facility. The groundwater pumping and treatment system (GWPTS) was re-started using GAC for treatment in July 2015. The system utilizes a groundwater recovery well, PRW-4, located approximately 800 feet southeast of the FTA. The groundwater treatment system (GWTS) itself is located in a structure on the FTA grounds.

In August 2015, Barnstable County funded a more detailed hydrogeological assessment, continued implementation of a groundwater pump and treat system to capture PFOS upgradient of the Mary Dunn wells, and additional assessment and immediate response actions. The Cape Cod Commission evaluated subsurface soil and groundwater conditions at the FTA facility as part of the IRA assessment activities. The soil results indicated a broad area of PFOS contamination throughout the subsurface. The highest PFOS concentrations were detected near the southwestern corner of the FTA, a location subsequently referred to as the hot spot.

Groundwater analytical results from the 2015 assessment revealed PFOS contamination ranging from less than 0.070 μ g/L) (the current US EPA HA) to greater than 70 μ g/L. The groundwater samples were collected from monitoring wells across the Site, located between the FTA and the Mary Dunn wells. Like the soil results, the highest PFOS concentrations were detected near the southwestern corner of the FTA.

In May 2016, US EPA revised/lowered its HA for PFAS from 0.20 μ g/L of PFOS and PFOA to 0.070 μ g/L for either compound or the total of the two.

EPA noted that the HA was for drinking water exposures only. In response to the lowered HA PFAS concentrations, on August 4, 2016, MassDEP issued a Notice of Responsibility (NOR) to Barnstable County and required submittal of an Immediate Response Action (IRA) Plan no later than September 15, 2016. MassDEP requested that the Site owner evaluate potential Imminent Hazards relative to downgradient public and private water supply wells.

MassDEP indicated that this evaluation should include identification of all nearby public and private water supply wells, review of any existing analytical data for those wells, and sampling and analysis of any nearby wells that have not been sampled for PFAS. MassDEP also stated that the IRA Plan should include measures to prevent, eliminate, and/or abate any hazards associated with the consumption of drinking water impacted by PFAS above the HA level of 0.070 ug/L.

MassDEP also required, as part of the IRA, activities to reduce the mass of PFAS at the FTA and the concentrations of PFAS in groundwater migrating from the FTA facility, such as excavating the soil hot spot and expanding the existing groundwater treatment system to decrease the mass of PFAS in groundwater.

On September 27, 2016, on behalf of Barnstable County, the Cape Cod Commission submitted an IRA Plan to MassDEP to address the PFOS/PFOA impacts. The IRA Plan included an evaluation of imminent hazards to downgradient public and private water supplies, specific plans for a Hot Spot removal action, and plans for an interim expansion of the existing groundwater pump and treatment system.

The IRA Plan also contained an evaluation of water supply alternatives. The proposed IRA to address the soil Hot Spot was to excavate up to 200 cubic yards from a 400 square foot area for off-Site disposal.

The Hot Spot soil was removed in January 2017, reducing the primary source of PFOS contamination leaching into groundwater. However, post-removal grading and settling of the backfill in the Hot Spot area left it prone to infiltration of runoff from the southern portion of the FTA.

Between December 2016 and February 2018, the Cape Cod Commission submitted 15 IRA Status and Remedial Monitoring Reports (RMRs) to MassDEP for the PFAS release. The RMRs addressed the FTA GWPTS, which is recovering and treating approximately 50,000 gallons per day (gpd) of groundwater from well PRW-4. The upgradient on-Site groundwater pump and treat system is also working to reduce PFAS concentrations in the aquifer before it reaches the Mary Dunn treatment system. Refer to Section 3.2 for further information regarding the on-Site GWPTS.

The GAC treatment of the Mary Dunn wells is actively preventing a potential Imminent Hazard to the Hyannis community by removing the PFAS compounds from the water supply. A Settlement Agreement is in place between the Town of Barnstable and Barnstable County that requires the County to fund a portion of the costs associated with operating the Mary Dunn wells treatment systems.

Timely exchange of pumping and performance data related to the treatment of the Mary Dunn well water supplies to verify effectiveness of the IRA is noted in the settlement agreement between the parties. On behalf of Barnstable County, BETA has submitted IRA Status reports and RMRs since March 2018. IRA Status and RMR reports have been submitted monthly since December 13, 2016.

As detailed in recent IRA Status and RMR reports, including this report, groundwater monitoring data for locations across the Disposal Site confirm that elevated PFAS concentrations are still present in Site groundwater. Analytical data from select monitoring wells indicate that PFAS concentrations in groundwater sampled in the former Hot Spot area have significantly decreased (following the Phase 1 stormwater improvements repair of the cap under the June 28, 2018 IRA Plan Modification); PFAS concentrations remain stable in groundwater sampled from wells east of the FTA; and PFAS concentrations remain elevated in groundwater sampled from within the area southeast of the FTA between the facility and the Mary Dunn wells. See Section 4.3 for the most recent (May 2021) groundwater monitoring data.

3.2 GROUNDWATER PUMP AND TREAT SYSTEMS

Response actions to address the early 1990s petroleum releases and the later detection of perchlorate included extensive subsurface assessment including installation of a significant network of monitoring wells.

In addition, to help remediate and control migration from the petroleum and perchlorate releases, in 1998 and 2007, respectively, response actions included the installation, upgrade, and/or renovation of a GWPTS at the Site. In July 2015 the decommissioned GWTS, formerly used to treat for perchlorate, was renovated and re-started to help remediate and contain the PFAS migration from the FTA; see below. The operational GWPTS was later noted in the NOR issued by MassDEP in August 2016 as part of the ongoing IRAs. The NOR also requested that Barnstable County install additional recovery wells or increase the groundwater recovery rate to increase PFAS removal; see discussion of GWTS# 2 below. The approximate locations of key components of the GWPTS that are located on the FTA are shown on Figure 2 – Site Plan Detail. The location of the operating recovery well, PRW-4, and the approximate route of the force mains (two, 2-inch polyethylene pipes) are shown on Figure 3 – Site Plan.

GWTS # 1

In July 2015, the primary influent/recovery well pump installed in recovery well PRW-4 was repaired, a new variable frequency drive (VFD) unit pump was installed in the treatment system, and all accompanying electrical components were evaluated and repaired. The system was restarted in July 2015 upon the installation of 1500 pounds (lbs.) of aqueous phase GAC (Filtrasorb 400 virgin GAC) into each of the two, existing Siemens treatment vessels. The "capture zone" of PRW-4 was reportedly estimated to be 200 ft. at 40 gallons per minute (gpm). Groundwater is pumped from recovery well PRW-4, through an eight-hundred-foot force main to the treatment building on the FTA; see Figures 2 and 3.

The groundwater is discharged to an equalization tank, then filtered through a 5–10-micron size bag filter and pumped through the two (in series) GAC vessels and discharged to the several large recharge chambers located in the center of the FTA, upgradient of the recovery well and approximately cross-gradient of the highest levels of PFAS contamination detected at the FTA property. See Fig. 2B for the location of the recharge basins. As appropriate to prevent breakthrough of the PFAS6 compounds , the GAC is periodically changed out.

GWTS # 2

As noted, the NOR also requested that Barnstable County increase the groundwater recovery and treatment rate to increase PFAS removal from the aquifer. In November 2019, a second, supplemental treatment system was installed, designated as GWTS#2, to treat water from the existing recovery well and better use its extraction capacity. The second force main was re-piped and connected via hose and hard piping to GWTS#2. The system is contained in a mobile structure (former shipping container) and is designed to treat PFAS-impacted groundwater (via adsorption technology with liquid phase granular activated carbon) at a target flow rate of approximately 30 gpm.

Since the inception of treatment for PFAS in 2015, the spent GAC is collected by the supplier, Calgon Carbon Corp., during the changeout procedure and transported to their facility for standard thermal regeneration. As noted above, the FTA GWPTS uses virgin GAC supplied by Calgon.

Currently, Groundwater Treatment Technologies, LLC (GWTT) is contracted by Barnstable County to provide O&M of the GWTS, including but not limited to, bag filter checks and replacements, VFD pump monitoring, carbon vessel backwashing, and GAC replacement oversight.

Additionally, BETA collects monthly samples for PFAS from both systems to check their treatment performance (See section 4.1).

3.3 PHASE I INITIAL SITE INVESTIGATION AND TIER CLASSIFICATION

In May 2018, a Phase I Initial Site Investigation (ISI) Report and Tier Classification Submittal was submitted to MassDEP by BETA (formerly Nover-Armstrong Associates) on behalf of Barnstable County in response to the discovery of concentrations of PFAS compounds in soil and groundwater exceeding applicable USEPA Health Advisory (HA) levels. The Phase I ISI confirmed that the primary contaminant of concern is PFOS and, to a lesser extent, PFOA.

Based on the compiled Phase I Initial Site Investigation data, BETA opined in the Phase I report that continuation of the IRA activities and additional assessment and, potentially, additional remedial Response Actions are warranted at the Disposal Site.

A Phase II Comprehensive Site Assessment Conceptual Scope of Work (SOW) was submitted with the Phase I ISI outlining the scope, nature of investigation, and sample programs proposed to characterize the risk of harm posed to health, safety, public welfare, and the environment (for regulatory closure). The Phase II SOW proposed additional remedial and/or response actions such as continued monitoring of the Site groundwater conditions, potential soil removal or modifications to the existing groundwater treatment system to be implemented in the near future. At a later date, MassDEP indicated that a formal Phase II Comprehensive Site Assessment SOW was required in addition to the Conceptual SOW.

A Tier Classification was submitted to MassDEP concurrently with the Phase I Report. Based on the need to continue remedial actions as IRAs under the current IRA Plan, and on the continuing need to abate a potential Imminent Hazard condition related to impacts to public water supplies, the RTN 4-26179 release was classified as Tier I.

3.4 FLINTROCK POND ASSESSMENTS

Per the Order of Conditions: Special Conditions of Approval (SE3-5606), Item 17, the Town of Barnstable Conservation Commission required "new testing results for PFAS in Flintrock Pond." From November 2019 to October 2020, BETA has conducted surface water and sediment sampling at Flintrock Pond.

Elevated concentrations of the total summed of the five PFAs chemicals (PFOS, PFOA, PFNA, PFHxS, and PFHpA) were documented in the pond sediments and surface water; however, no MassDEP or US EPA regulatory standards or guidelines for sediment and surface water are available for comparison.

Concentrations of PFAS documented within Pond sediments are dominated by the PFOS and PFHxS compounds and increase with distance from the Pond's bank. Refer to the previously completed IRA Status Reports submitted to MassDEP for complete information on the assessment to date of Flintrock Pond.

Future Assessment

In response to Commission input and to meet MCP requirements, a comprehensive assessment program for the pond is under development to be implemented during the Phase II CSA. Barnstable County and BETA, in conjunction with Barnstable County dredging department, will develop/construct cable crossings of the pond with a means to move a small float or a boat to systematically cross the pond, while obtaining sediment samples from permanent/consistent locations throughout the Pond. The planned sediment sampling and the pond's ecological risk assessment per the requirements of 310 CMR 40.0830 and particularly at 40.0995. Additional sampling, especially spatially, will be conducted to complete the overall conceptual site model as part of Phase II Site assessment and to select and implement a remedial alternative for the Disposal Site. The proposed program is presented in the recently submitted Public Comment Draft Phase II Comprehensive Site Assessment SOW; see Section 3.7.

3.5 SAMPLING AND ANALYSIS FOR PFAS

Following the collection of aqueous and/or soil samples for the analysis of PFAS compounds, BETA submits all samples to Bureau Veritas Laboratories (BV Labs) (formerly Maxxam Analytical) for the analysis of PFAS via USEPA Method 537 modified.

BV Labs is an accredited laboratory located in Mississauga, Ontario that has performed the PFAS analyses for all samples collected from the Disposal Site since the assessment for PFAS impacts began.

BV Labs reports the concentrations of 23 PFAS compounds from aqueous and soil samples with laboratory detection limits as low as 2.0 ng/L (ppt).

However, for the purposes of achieving the low laboratory detection limits to compare against the MCP GW-1 Standard of 20 ppt for the monthly performance samples collected at the treatment systems, BV Labs is only able to report 21 PFAS compounds; two additional fluorotelomers are not reported.

Upon receipt of a laboratory report, BETA reviews the concentration data as well as the laboratory case narrative and quality assurance report to ensure no bias is present. BETA summarizes and tabulates the analytical results of six PFAS compounds (PFOS, PFOA, PFNA, PFHxS, PFHpA, and PFDA) based on the MassDEP MCP PFAS risk standards (December 2019).

BETA presents the tabulated data and includes the laboratory analytical reports (or Certificates of Analysis) for that reporting period in the monthly IRA Status and RMR reports; the summary data tables, and laboratory analytical reports are included as attachments to these reports.

3.6 PUBLIC INVOLVEMENT

In January 2019, a petition from a group of residents of Barnstable and Hyannis, MA was received, requesting that the Site be designated a Public Involvement Plan (PIP) Site. In response to the request from the local petitioners, Barnstable County designated the Site as a PIP site and has begun PIP activities in accordance with 310 CMR 40.01404. Notification of the Site Designation and the initial public meeting was provided to all petitioners and the Town of Barnstable officials in writing in February 2019.

On May 2, 2019, a public meeting was held, and a Draft Public Involvement Plan (PIP) was prepared, presented, and distributed. Public comments (as they relate to the response actions implemented for the release of PFAS at the Site and are in accordance with 310 CMR 40.01404) have been incorporated into the final Plan, which was finalized on June 27, 2019.

3.7 PUBLIC COMMENT DRAFT PHASE II COMPREHENSIVE SITE ASSESSMENT SCOPE OF WORK

As noted in 3.3, MassDEP indicated that a formal Phase II Comprehensive Site Assessment (CSA) SOW was required for the RTN 4-26179 PFAS Release Site. On July 16, 2021, a Public Comment Draft Phase II Comprehensive Site Assessment (CSA) Scope of Work was submitted via eDEP and is available for public comment. This Draft Phase II CSA SOW document describes the robust assessment activities proposed to meet the objectives as stated in the MCP at 310 CMR 40.0833. Per Section 4.23 of the Final PIP, "Public Comment Periods," comments will be accepted on this Draft Phase II CSA SOW prior to finalization of the document. The public comment period will be open for 21 days, beginning on the date of distribution (July 20, 2021) to the PIP mailing list of the notice of availability of the Draft Phase II CSA SOW.

4.0 HISTORICALLY AND RECENTLY COMPLETED IRA ACTIVITIES

Since the submittal of the IRA Plan in September 2016 (as described in section 3.0), remedial response actions and assessment activities have continued to address the PFAS impacts at the Site. Most notably, the Barnstable County and the Cape Cod Commission implemented response actions to refurbish and restart an existing, but not operating groundwater pump and treatment system in 2015 and oversaw the excavation of 200 cubic yards of PFAS impacted soils from the former "Hot Spot" area (a 400 square foot area) for off-Site disposal in January 2017.

From December 2018 through February 2019, Barnstable County implemented the regrading and temporary capping of the southwest corner of the FTA, including the former Hot Spot area, with related stormwater controls, termed the Phase I Stormwater Management Improvements/IRA Plan Modification. Additional details regarding the Phase I Stormwater Management Improvements are included in the February 2019 Reporting Period IRA Status No. 27 Report.

In November 2019, the County procured and started a second treatment system, GWTS #2, in an effort to increase the treatment capacity of groundwater from PRW-4. As a result groundwater conveyed from PRW-4 was split and re-piped and to both GWTS #1 and GWTS #2.

The following is a summary of the historic, continuing, and recent IRA response actions completed at the Site. Additional details regarding these IRA response actions can be found in previous IRA Status submittals.

4.1 CONTINUING OPERATION & MAINTENANCE OF GWTS

Cape Cod Commission oversaw and documented the GWPTS performance on behalf of Barnstable County from July 2015 through February 2018. The Cape Cod Commission also conducted groundwater monitoring and operation of the recovery well, PRW-4.

Monthly performance monitoring samples have been collected since GWTS #1 startup in July 2015, from the influent (PRW-4), midpoint, and effluent sample locations. Since November 2019, performance samples have been collected monthly from both GWTS #1 and GWTS #2.

Periodic monitoring of the system is required to maintain operation of the VFD and recovery well pump including carbon exchanges, regular backwashing of the carbon vessels, force mains cleanouts, and replacement of the recovery well pumps. This work is currently performed by a wastewater treatment system operator, GWTT, under contract with the County. Since November 2019, GWTT maintains and operates both GWTS#1 and GWTS#2 systems.

IRA activities related to the operation and maintenance of the GWPTS conducted during earlier reporting periods have been described in detail in previously completed IRA Status Reports submitted to MassDEP. Refer to those submittals for complete information. The previously submitted documents are available in MassDEP Sites Database; refer to the follow link to access these reports.

https://eeaonline.eea.state.ma.us/portal#!/wastesite/4-0026179.

On behalf of Barnstable County, BETA submits the IRA monthly remedial monitoring reports and status reports summarizing pump and treat system operations for the respective reporting period. System sampling and IRA Status and RMR submittals continue monthly; these submittals always include the PFAS analytical summary data table from the monthly system samples and the respective laboratory analytical report. As noted previously, the laboratory reports for monthly GWTS performance monitoring provide the results for 21 PFAS compounds in order to allow for lower laboratory reporting limits.

Health Advisories and Regulatory Standards Used for Comparison

During the initial two years of the GWPTS operation (July 2016 through June 2018), the USEPA revised Health Advisory (HA) of 0.070 μ g/L for two PFAS chemicals, Perfluorooctanoic acid (PFOA) and Perfluorooctanesulfonic acid (PFOS), was used for comparison to the analytical results of GWPTS performance samples. The HA (revised downward to 0.070 μ g/L in July 2016) applied to each compound individually or for the total concentration of the two (PFOS and PFOA).

At that time, MassDEP adopted the USEPA HA. The USEPA considers its HA to still be in effect (as of March 2020). However, for MCP purposes it has been superseded by the promulgation (by MassDEP) of MCP risk standards for the PFAS6 compounds and Maximum Contaminant Levels for the PFAS6 under the Massachusetts Drinking Water regulations – see below.

On June 11, 2018, MassDEP's Office of Research and Standards (ORS) issued an updated ORS Guideline/HA that applied to the individual concentrations or the total summed of five PFAS chemicals: PFOS, PFOA, Perfluorononanoic Acid (PFNA), Perfluorohexanesulfonic Acid (PFHxS), and Perfluoroheptanoic Acid (PFHpA).

From June 11, 2018 until December 2019, individual concentrations of any of these five compounds or the total concentrations of all were compared to the MassDEP ORS HA of 0.070 µg/L.

On April 19, 2019, MassDEP released the Public Comment Draft of proposed revisions to the MCP, which included proposed Method 1 groundwater risk standards for the five PFAS compounds, plus an additional PFAS compound, Perfluorodecanoic Acid (PFDA). A Method 1 GW-1 risk standard of 0.020 µg/L was proposed for the individual concentrations of any of these six compounds or the total concentrations of all six. In December 2019, MassDEP published final MCP Method 1 risk standards for the PFAS6 compounds with an effective implementation date of December 27, 2019. From May 2019 through the current reporting period, tabulated treatment system analytical results have been compared to the six regulated PFAS compounds. The final MCP PFAS risk standards for groundwater include the 6 PFAS compounds of concern (PFAS6) listed above and the 0.020 µg/L¹ which is the GW-1 numerical risk standard for each compound or for the total of the PFAS6. These MCP risk standards are included in all relevant tables in the monthly and quarterly monitoring reports. Except where noted (due to older data), total PFAS concentrations reported and discussed in this report are the sum of concentrations of the PFAS6 compounds included in the final MCP risk standards of December 27, 2019.

4.2 CURRENT OPERATION & MAINTENANCE OF GWPT SYSTEMS

During the May 2021 reporting period, the primary treatment system (GWTS #1) and secondary system (GWTS #2) were in operation for all or portions of approximately 31 days.

On May 20, 2021, BETA collected performance samples from both GWTS #1 and GWTS #2 systems, which were both in operation at the time of sample collection.

4.2.1 REMEDIAL MONITORING REPORT – GWPTS #1

GWTS # 1 System Monitoring Results

As noted, system samples were collected on May 20, 2021 from the Influent (PRW-4), Midpoint and Effluent ports and were submitted to Bureau Veritas Laboratories (formerly Maxxam Analytics) of Mississauga, Ontario (Bureau Veritas) for the laboratory analysis of Total PFAS via USEPA Method 537 M

Refer to the attached Table 1A, for a summary of the GWTS #1 PFAS analytical data. The complete laboratory report is attached in Appendix B.

¹ Concentrations of PFAS are presented in the data tables of this report in nanograms per liter (ng/L), also referred to as parts per trillion (ppt) and are reported by the laboratory in those units. However the published MCP Method GW-1 numerical risk standards for PFAS compounds (PFOS, PFOA, PFNA, PFHpA, PFHxS, and PFDA) are in presented in or micrograms per liter (μg/L), also referred to as parts per billion (ppb). In the relevant sections of this report, results are shown in both units.

11

Recovery well PRW-4 is the source of the Influent groundwater. The total sum of the six Massachusetts regulated PFAS (PFAS6) concentrations in the Influent (PRW-4) sample was 1,217 ng/L (1.217 μ g/L), well above the GW-1 risk standards. However, the total PFAS6 concentrations in the Influent continued a downward trend observed since November 2020. Five of the six regulated PFAS compounds were detected at concentrations exceeding the MCP GW-1 risk standard (0.020 μ g/I); PFDA was detected at concentrations below the MCP GW-1 standard. Based on the splitting of flow from PRW-4 to both groundwater treatment systems, the Influent analytical results apply to GWTS #2, as well as GWTS #1.

The PFAS6 (six MA regulated PFAS compounds) were detected above laboratory detection limits in the Midpoint Sample. four of the PFAS6 compounds (PFOS, PFNA, PFHxS, and PFHpA) were detected at concentrations above the applicable MCP GW-1 risk standard. For the purposes of achieving the lowest MDLs and RDLs ² (for comparison to the MCP Method 1 Groundwater standards), Bureau Veritas reports the results for 21 PFAS compounds, including two (2) PFAS precursors; this allows the laboratory to achieve RDLs as low as 2.0 ng/L. The laboratory report provides details of MDLs and RDLs for each PFAS compound included in the analyte list. Following the review of the increasing PFAS6 concentrations in the Midpoint Sample, the changeout of the GAC was planned; the carbon changeout occurred on July 6, 2021.

Although four of the PFAS6 compounds were detected above risk standards in the Midpoint sample, PFAS6 concentrations were below the laboratory detection limits in the Effluent Sample and the detection and reporting limits were below the applicable MCP Method 1 GW-1 standards. Additionally, the remaining 15 reported PFAS compounds are reported below the laboratory RDLs and MDLs in the Effluent sample except for Perfluoropentanoic Acid (PFPeA) which was detected at 0.71 ng/L. Refer to the Table 1A and the complete laboratory report in Appendix B for laboratory RDLs and MDLs.

GWTS #1 Operational Details

The attached Table 2A presents the GWTS #1 performance data. For the May 2021 reporting period, the overall (average) system flow rate and gallons of groundwater treated are based on the effluent flow meter/totalizer readings reported for the system by the O&M contractor.

On this basis, approximately 0.31 million gallons of groundwater were treated during this May 2021 reporting period, at an average effluent flow rate of 7.0 gpm. Based on the approximate 0.31 million gallons treated and total influent concentration of 1.217 µg/L (May 2021 sample results), approximately 0.0015 kilograms of PFAS were estimated to have been removed from the plume area during this reporting period. As shown on Table 2A, average Effluent Flow Rates were low during the first half of the period, assumed to reflect the low influent rates to the system. During later weeks of the period, the effluent flow rates increased slightly; GWTT increased the flow rate at the VFD to help with back pressure build up at the bag filter.

The estimated, instantaneous combined influent flow rates (for both systems) ranged from approximately 43.8 gpm to 8.8 gpm (the approximate average instantaneous flow rate for both systems was 30.9 gpm). Due to the method used to estimate the instantaneous influent flow rate (timing of rise of groundwater in the GWTS #1 Equalization Tank with both force mains discharging to it), the estimated influent flow rates noted above apply to both systems, combined. Therefore, during the normal mode of operation, with the flow from each force main flowing to only one system, it is assumed that roughly 50% of the instantaneous influent rates stated above actually flows to GWTS #1 for treatment.

² Method Detection Limits and Reportable Detection Limits.

Both the estimated, instantaneous <u>combined</u> influent and individual system flow rates are tabulated in Table 2A. The average estimated instantaneous flow rate for GWTS #1, approximately 15.4 gpm, is calculated based on the assumption that 50% of the total flow goes to GWTS #1. During the May reporting period, the instantaneous influent flow rates (indicative of the output of PRW-4 and conveyance capacity of the influent force mains from the well to the treatment systems), started at low values (approximately 9 gpm), similar to the end of April 2021, and then increased by a factor of 4 and remained between approximately 32 to 42 gpm for the remainder of the period. The factors resulting in this increase in flow rate are not known. Precipitation reported for the month was abnormally low. Refer to the attached Table 2A for a summary of the GWTS #1 performance details.

As detailed in the IRA Status and RMR reports from the previous 2020 reporting periods and following the replacement of the submersible pump in PRW-4 in November 2020, iron-oxide sediment appears to be continuing to impact the system flow rates. In an effort to combat the iron-oxide sedimentation build-up and maintain the efficacy of groundwater treatment (PFAS removal) GWTT has continued to perform backwashes of the carbon vessels; the primary carbon vessel was backwashed on May 28, 2021. Additionally, GWTT reduced the effluent flow rate of the transfer pump in the first half of the reporting period in an effort to reduce the amount of iron oxide sediment/sludge being drawn from the EQ tank into the bag filters and GAC vessels Backwashing the GAC vessels has helped maintain the lifespan of the GAC, but GWTT continued to observe significant iron oxide sediment fouling within both systems during the reporting period. Iron sediment has been observed significantly accumulating in the EQ tank; it then fouls the bag filters and the GAC vessels when pumped through the system's treatment process. This affects the efficiency of the treatment; therefore, GWTT reduced the effluent flow rate (transfer pump flow rate) to reduce excess iron oxide carry over from the EQ tank. But, as reported in Table 2A, the flow rate of the transfer pump was increased for the second half of the reporting period.

4.2.2 REMEDIAL MONITORING REPORT – GWPTS #2

GWTS # 2 Monitoring Results

As previously mentioned, BETA collected performance samples from GWTS #2 system on May 20, 2021. Samples collected from the Influent (PRW-4), Midpoint, and Effluent ports were submitted to Bureau Veritas for the laboratory analysis of Total PFAS via USEPA Method 537 M. As noted above, recovery well PRW-4 is the source of the Influent groundwater to both groundwater treatment systems. Therefore, the Influent analytical results apply to GWTS #2, as well as GWTS #1.

The attached Table 1B, summarizes the GWTS #2 PFAS analytical data. The complete laboratory report is attached in Appendix B.

As previously mentioned, the tabulated treatment system analytical results from GWTS #2 are reported and compared to the PFAS6 compounds and their respective MCP Method 1 GW-1 Standards. The total sum of the six PFAS concentrations in the Influent sample was 1,217 ng/L (1.217 μ g/L), well above the GW-1 risk standards. Five of the six regulated PFAS compounds were detected at concentrations exceeding the new MCP GW-1 risk standard (0.020 μ g/l or 20 ng/L).

The PFAS6 compounds were not detected at concentrations above the laboratory reporting limits in this May 2021 Midpoint sample; however, five of the PFAS6 compounds were detected at concentrations above the laboratory reporting limits and the PFOS concentration and total sum of the PFAS6 concentrations detected in the Effluent sample were above the GW-1 risk standard. The results are summarized in Table 1B and a copy of the laboratory report is in Appendix B.

The laboratory report was received late on June 2, 2021 and BETA notified the County and its system operator GWTT of the breakthrough of PFAS6 at GWTS#2.

The system was shut down on June 3, 2021 until a carbon changeout could be schedule. The County and Calgon initiated the process of contracting for and scheduling a carbon changeout. Due to significant freight delays and scheduling delays, the carbon changeout was not conducted until July 6, 2021. Details regarding the changeout will be included in an IRA Status Report and RMR for the July 2021 reporting period.

GWTS #2 Operational Details

The attached Table 2B summarizes the GWPTS performance details.

As described in previous sections, during the normal mode of operation, with the flow from each force main flowing to only one system, it is assumed that roughly 50% of the instantaneous influent rates discussed above for GWTS #1 actually flows to GWTS #2 for treatment. Based on that assumption, for the May 2021 reporting period, the calculated average estimated instantaneous flow rate for GWTS #2 was approximately 15.4 gpm. As noted in the GWTS #1 performance review above, during the May reporting period, the instantaneous influent flow rates (total to both systems) started at low values, similar to the end of April 2021, and then increased by a factor of 4 and remained between approximately 32 to 42 gpm for the remainder of the period. The factors resulting in this increase in flow rate are not known.

The overall (average) system flow rate and gallons of groundwater treated were based on the Effluent flow rate/net totalizer readings reported for the system by the O&M contractor; approximately 0.41 million gallons of groundwater were estimated to be treated during this reporting period for May 2021, at an approximate average effluent flow rate of 9.1 gpm. On May 10, 2021, GWTT increased the effluent flow rate from the transfer pump in an effort to combat the iron sediment build up in the EQ tank that continued to foul the bag filters and GAC vessels. However, on May 25, 2021, the system was in a high-pressure alarm due to significant iron fouling of the bag filters and GAC vessels. GWTT conducted a backwash on the primary GAC vessel on May 28, 2021.

Based on 0.41 million gallons treated, approximately 0.002 kilograms of PFAS were estimated to have been removed from the plume area during this reporting period.

4.2.3 REMEDIAL MONITORING REPORT SUMMARY

During the May 2021 reporting period, the two treatment systems, GWTS #1 and GWTS #2, were in operation for all or portions of approximately 31 days. The overall (average) system flow rate and gallons of groundwater treated are based on the available Effluent flow totalizer readings reported for both systems by the O&M contractor. For the reporting period from May 1 to May 31, 2021 both systems treated an approximate combined 0.72 million gallons of groundwater from the (downgradient recovery well PRW-4) at an average, total (of the two systems) effluent flow rate of 16.2 gpm.

Based on the total 0.72 million gallons treated, approximately 0.003 kilograms of PFAS were estimated to have been removed from the plume area during this May 2021 reporting period.

Figure 5 depicts the concentration trends observed in groundwater at the extraction well PRW-4, as measured as the Influent to the groundwater treatment systems. In addition, the Midpoint concentrations for GWTS #1 are graphed. Due to the nature of the laboratory data reported since 2015, this graph depicts the total of the PFOS and PFOA compounds only. Following a spike in concentrations in mid-2019, PFOS and PFOA concentrations have generally decreased or remained relatively stable at PRW-4. The detected concentrations remain elevated relative to the GW-1 risk standards.

4.3 QUARTERLY GROUNDWATER MONITORING

Groundwater monitoring activities related to the documented PFAS Release on Site have been ongoing since November 2013. BETA, formerly Nover-Armstrong Associates, was contracted by Barnstable County to provide LSP and environmental services in April 2018 and has conducted groundwater monitoring activities since June 2018.

In November 2018, BETA proposed a long-term monitoring sampling plan for Site-wide groundwater monitoring on a quarterly and annual basis. Following discussion, MassDEP approved of the sampling plan that included sampling of twelve (12) wells during three quarterly sampling events and sampling an additional eight (8) wells (for a total of twenty (20) during the annual sampling round.

A copy of the plan can be found in previous IRA Status report submittals, including IRA Status Report and RMR No. 35 for the October 2019 reporting period. Additional monitoring points are added to either the quarterly or annual sampling round, as warranted to meet specific objectives or provide additional coverage.

BETA has conducted quarterly groundwater assessments since January 2019 under the approved program. The January 2019 event was selected as the original annual monitoring program for 2019 utilizing the selected 20 monitoring wells. In order to support the design of the proposed groundwater recovery expansion (an IRA Plan Modification), it was decided to move the annual monitoring round up to October 2019, and to add several wells to the sampling program. Subsequently, the annual groundwater monitoring program is held annually in October.

4.3.1 MAY 2021 SITE-WIDE QUARTERLY GROUNDWATER SAMPLING AND ANALYSIS

On May 19 and 20, 2021 BETA conducted a quarterly groundwater monitoring event based on the MassDEP approved sampling plan. A total of 15 monitoring wells were sampled for laboratory analysis of total PFAS by EPA Method 537 Modified. On those dates the following monitoring wells were sampled: HSW-6, PFW-1, PFW-5, OW-8A, PC-1, PC-6A, PC-11, PC-16d, PC-28, PC-30, PC-38, MW-12, MW-22, FS-1A, MW-201 and MW-215. The May 2021 program included additional monitoring wells MW-201 and MW-215 that were installed at the FTA in January 2021 during the pre-capping FTA soil assessment program (which was presented in the January 2021 reporting period status report. Additionally, monitoring well PC-38 was added to the standard quarterly sampling program. Figure 2 and Figure 3 depict sampling locations.

All sampled wells and all wells located within the immediate vicinity of the FTA property were gauged prior to sampling. Groundwater gauging data and groundwater elevation data are included in Table 3, appended.

Monitoring wells HSW-6, PFW-1, PFW-5, OW-8A, FS-1A, MW-201, and MW-215 are located on the FTA property; HSW-6 is located within the former Hot Spot remediation area and PFW-1 is located approximately 130 feet downgradient (of the former Hot Spot remediation area). PFW-5 and OW-8a are located cross-gradient of the Hot Spot area on the FTA property; MW-201 d abuts the fence line on the northern portion of the property and MW-215 is located within the inner track just north of GWTS#1.

Monitoring well PC-38 is located south (cross-gradient) of the FTA property.

The downgradient monitoring wells (MW-12, MW-22, PC-1, PC-11, , and PC-6A), between the FTA and the recovery well (PRW-4), were selected based on previous results to evaluate current conditions within the main PFAS plume.

Monitoring wells PC-9, PC-16d, PC-28, and PC-30 are located in the probable downgradient direction from recovery well PRW-4. Monitoring well PC-38 is located in the most southeastern downgradient location from the FTA.

A tabulated summary of the PFAS analytical data for the monitoring wells within the Disposal Site Boundary, including the results of the most recent May 2021 sampling round is included in Table 4.

Copies of the laboratory reports/certificates of analysis are included in Appendix B.

As previously discussed, effective December 27, 2019, MCP groundwater risk standards for 6 PFAS compounds, (PFOS, PFOA, PFHpA, PFNA, PFHxS, and PFDA) apply to the Site with a GW-1 risk standard of 20 ng/l for the total and/or any single compound. These risk standards are included on Table 4.

Individual concentrations of one or more of the (regulated) PFAS6 compounds and Total Concentrations of the PFAS6 detected in the samples from all wells during the May 2021 sampling event were above the MCP GW-1 risk standards, except at PC-38.

In summary, PFAS concentrations detected in groundwater across the Disposal Site during the May 2021 round of groundwater assessment are similar to historic ranges, with exceptions discussed below. Although the total PFAS6 concentrations currently regulated by MassDEP documented in groundwater within the Disposal Site are significantly above the current applicable MCP Method 1 risk standards, concentrations have trended towards a significant, yet stable decrease, with exceptions discussed below, since PFAS assessment activities started at the Site in 2015, especially in the Hot Spot/ Phase 1 cap area.

BETA's review of the May 2021 groundwater data compared to historic sampling events indicates concentrations of PFAS documented in wells located on the FTA property and immediately east continue to appear to be falling or relatively stable. Figures 6 through 8, attached and discussed below, are graphical presentations of total (sum of) PFAS6 concentrations for selected monitoring wells in representative locations in this portion of the Disposal Site. It should be noted that the graphs depict discrete periodic sampling events at varying intervals from initial sampling in April 2015 and at quarterly intervals (typically) since January 2019. See Table 4 for sampling dates and PFAS6 concentrations detected for all sampling events. The laboratory reports in Appendix B include all PFAS analytical results, including laboratory detection and reporting limits, for the May 2021 sampling event.

Figure 6 depicts the concentration trends observed in groundwater at monitoring well PFW-1. Since the implementation of the Phase I stormwater improvements during the winter of 2018/2019, which included installing an impermeable cap over the former Hot Spot removal area and adjacent areas and diverting stormwater, PFAS concentrations have generally decreased significantly through mid-to late-2019 and have since remained relatively steady at elevated levels relative to the GW-1 risk standards.

Figure 7 depicts the significantly downward trend of PFAS6 concentrations observed in groundwater monitoring well OW-8A, which is located on the northeastern portion of the FTA, through the October 2020 quarterly sampling event. A noticeable increase in PFAS6 total concentrations from the October 2020 to the January 2021 sampling event is observed. Although the cause of this increase is not known, it is of BETA's opinion that increased precipitation may have influenced the concentration spike in the January 2021 sampling event; the detected concentrations observed from the May 2021 sampling event are approximately 700 ppt less than concentrations observed in January 2021.

Figure 8 depicts the continued stable trend in PFAS concentrations documented at monitoring wells MW-12 and MW-22 respectively. It would appear that the concentrations from MW-22 have increased significantly and that the concentrations from MW-12 have decreased.

However, based on the consistent concentration trend observed from these two wells since 2018, BETA opines that the samples were incorrectly labeled. It is not known at this time if concentration trends at MW-22 may be related to rates of withdrawal of water from the aquifer at Mary Dunn PWS #3 (MD-3)located approximately 535 feet east of MW-22.

PFAS concentrations documented in wells located farther southeast and downgradient of the FTA, specifically PC-6A, PC-11, PC-28, PC-16D, and PC-30, have variable trends. Figures 9A, 9B, 9C, and 9D depict PFAS concentration trends in PC-11, PC-6A, PC-28, and PC-30 respectively. Groundwater concentration trend at PC-28 appears to be decreasing since October 2020. PFAS6 concentrations at PC-11 (Fig. 9A) and PC-30 (Fig. 9D) show a marked increase in the spring and/or summer of 2019 followed by a significant decrease followed by continued stable concentrations. PC-6A (Fig. 9B) shows highly variable concentrations; however, concentrations observed since the Spring of 2019 have trended to decrease and remain stable.

Monitoring well PC-38, the furthest south-southeast (PC-38) location, sampled during this quarterly monitoring event, did not exhibit PFAS6 concentrations above the laboratory reporting limits.

See Table 4 and the laboratory report (Appendix B) for analytical details for the May 2021 sampling event.

The causes of the variable concentration trends observed at some wells (specifically PC-6A, PC-28, and PC-30) located further south and southeast of the FTA (towards Mary Dunn Pond) are not clear; however, based on the May 2021 data, the concentrations appear to be decreasing. The trends may be influenced by variable groundwater extraction by the current FTA pumping system, variable pumping rates of the three active Mary Dunn municipal wells and the Hyannis Airport supply well (located east-southeast of Mary Dunn Pond), and the timing and duration of operation of the Mary Dunn and Airport wells. The well pump at PRW-4 was underperforming from July 2020 to November 2020, when it failed requiring replacement of the well pump and piping. The well casing, pump, and riser piping were found to be severely fouled with iron oxide sediments. The failure of the well pump and downtime for replacement may be a contributory factor for the PFAS6 concentration increase observed at PC-28. Concentrations appear to be decreasing now which may be attributable to restoration of extraction rate and capture at PRW-4.

Utilizing the total sum of the six regulated PFAS compounds, concentration data were interpolated to depict an approximate concentration plume map based on the May 2021 monitoring results. Figure 10 depicts the concentration plume for the May 2021 monitoring results; the highest concentrations within the PFAS contaminant plume appear to be concentrated on the south end of the Site and in the vicinity of PRW-4. The lowest concentrations (below the Method 1 GW-1 standards) are on the outer northeastern and southeastern edges of the plume. It should be noted that the appearent increase in the PFAS6 concentrations at MW-22, discussed above, result in the appearance of higher concentrations (indicated by red shading) on Figure 10 west of Mary Dunn well #3. As noted above, there are indications that the May 2021 data for MW-22 actually apply to MW-12 and vice-versa.

4.3.2 SITE-WIDE GROUNDWATER GAUGING AND ELEVATION SURVEY

BETA gauged depth to groundwater in the monitoring wells located on and within 100 feet of the FTA and in selected monitoring wells east and southeast of the FTA on May 19, 2021. The Table 3 presents a tabulated summary of the seasonal groundwater elevation data (from 2018-2021) for selected monitoring points across the Disposal Site.

Groundwater flow is inferred to be to the south-southeasterly direction. Refer to Figure 11 for a depiction of the calculated groundwater flow from the May 2021 gauging event. The gauging results indicate moderate influence from the operating recovery well, PRW-4.

5.0 SITE WIDE CAPPING AND SELECT BUILDING DEMOLITION

In response to the Request for Expedited Immediate Response Action Plan Modification/Interim Deadline-Enforcement Document Number 6694, dated May 1, 2019 issued by the Massachusetts Department of Environmental Protection (MassDEP) and amended by email correspondence by the MassDEP, BETA (on behalf of the County) submitted a Draft IRA Plan Modification to DEP detailing preliminary plans for the expansion of the groundwater recovery and treatment system and capping measures to prevent infiltration of precipitation through the soils at the Site. Following the receipt of public comment, the IRA Plan Modification was finalized in December 2019 and design plans for Sitewide capping were submitted for approval to the Town of Barnstable via a Notice of Intent in February 2020. Final design approval and an Order of Conditions was obtained in November 2020 and January 2021 respectively.

The construction of the capping design will be funded via the Clean Water Trust State Revolving Fund (CWTSRF); the County received Bids for the project in April 2021. An IRA Plan Modification No. 3 was finalized and submitted electronically to DEP following the receipt of public comment on June 22, 2021. As the report stated, due to the nature of the project and its source of financing, it is not feasible to incorporate additional public comments into the final report. The capping project was awarded in July 2021. Construction is anticipated to begin in August 2021. Details of execution of the project will be included in future IRA Status reports.

6.0 IRA EVALUATION

In accordance with the MCP, this section presents evaluations of potential IRA conditions at the Site.

6.1 ASSESSMENT FOR SUBSTANTIAL RELEASE MIGRATION (SRM)

Due to the documentation that PFAS has most likely migrated more than 200 feet downgradient and has been detected in a public water supply well and surface water body, the Site meets the criteria for a Condition of Substantial Release Migration (SRM), as defined by 310 CMR 40.0006.

6.2 IDENTIFICATION OF CRITICAL EXPOSURE PATHWAYS (CEP)

No Critical Exposure Pathways, as defined by 310 CMR 40.0006, currently exist at the Disposal Site.

6.3 IMMINENT HAZARD (IH) EVALUATION

Based on the concentrations of PFOS exceeding the USEPA HA level in the Mary Dunn wells in 2013, the Cape Cod Commission identified the presence of an Imminent Hazard (IH) condition pursuant to 310 CMR 40.0321(2)(c).

The GAC treatment of the Mary Dunn Wells has been assumed to be actively preventing a potential Imminent Hazard to the Hyannis community by removing the PFAS compounds from the water supply.

The Mary Dunn wells are monitored on a regular basis by the Hyannis Water Department to ensure that exposure to humans is less than the USEPA HA, the MassDEP Drinking Water Standards effective on December 27, 2019 and the finalized MassDEP MCL (MMCL) standard.

MassDEP finalized the MMCLs for PFAS in January 2021; the final MCL for PFAS in drinking water is 20 ng/l and applies to the 6 regulated PFAS compounds.

6.4 ASSESSMENT OF NEED FOR IMMEDIATE RESPONSE ACTIONS (IRA)

The operation of the on-Site groundwater pumping and treatment system to reduce PFAS concentrations downgradient of the FTA will continue as an IRA. Continuation of assessment IRAs is warranted; specifically, periodic monitoring of groundwater at the Site and monitoring the PFAS treatment of the output of the Hyannis Water District/Town of Barnstable operated Mary Dunn Wells.

However, Site-wide assessment will also be proceeding under the Phase II Comprehensive Site Assessment (CSA) Scope of Work (SOW); the SOW has been submitted and the public comment period for the Public Comment Draft Phase II CSA SOW is under way at this time. Additional technologies to treat / remove PFAS from soil and groundwater at the FTA may be evaluated as part of the MCP Phase III evaluation of remedial alternatives.

In addition, planned expansion of groundwater extraction and treatment, as mandated by MassDEP, was described conceptually in the final December 2019 IRA Plan Modification. The final design and implementation of that component of the IRA Plan Modification is being re-evaluated in terms of feasibility of implementation as an IRA and potential overlap and duplication with MCP Phase III and Phase IV (remedy implementation) work to be conducted immediately following the completion of the Phase II CSA.

7.0 PUBLIC NOTIFICATIONS

Copies of public notification letters regarding the proposed IRA activities sent to officials of the Town of Barnstable in accordance with MCP 310 CMR 40.1403(3) (a) requirements are included as Appendix D. Per the Final PIP, email and written notifications regarding the submittal of this IRA Plan Modification to MassDEP and the availability of the Plan at the Site repository will be sent to those listed on the PIP Mailing List.

Notes:

- 1. Concentrations presented in ng/L nanograms per Liter parts per trillion
- 2. MassDEP's Office of Research and Standards (QRS) expanded upon the USEPA's Health Advisory and created the ORS Guideline that applies to the total summed of five PFAS chemicals, PFOS, PFOA, PFNA, PFNA, PFHxS, and PFHpA, effective June 11, 2018.
- 3. Concentrations of the PFAS compound, PFDA, are presented based on the April 19, 2019, MassDEP draft of new/proposed groundwater standards for PFAS that includes a sixth, PFAS compound, PFDA. However the concentration of PFDA is not include in total PFAS removal calcuations.
- 5. BRL Below Laboratory Reporting Limits; reporting limit shown in parentheses.
- Concentrations in bold exceed applicable MassDEP ORS Guideline
- 7. PFOS Perfluorooctanesulfonic acid
- 8. PFOA Perfluorooctanoic Acid
- 9. PFNA Perfluorononanoic Acid
- 10. PFHxS Perfluorohexanesulfonic Acid
- 11. PFHpA Perfluoroheptanoic Acid
- 12. PFDA Perfluorodecanoic Acid
- 13. --: Concentration data not available and/or sample was not collected on that date.
- 14. Per MCP Regulations, the system was sampled one day, three days, and seven (7) days following the initial week of startup (11/11/19).
- 15. On December 13, 2019, MassDEP published the newly established clean up standards for PFAS in soil and groundwater. These standards were effective as of December 27, 2019 and apply to the total sum of six PFAS chemicals, PFOS, PFOA, PFNA, PFHAS, PFHAS
- 16. The December monthly sample was collected from the system's effluent stream on 12/17/2019 following the receipt of the laboratory results from the 11/19/2019 sampling event on 12/16/2019.
- The effluent was resampled again to ensure significant breakthrough was not occurring from the secondary carbon vessel.

 1. G: Coastal Engineering, GWIT: Groundwater Treatment Technologies
 2. Prior to November 2019, the instantaneous influent (INF) and effluent (EFF) flow rates are calculated based on the cross-sectional volume per vertical foot of the influent tank and the measured/timed filling (INF) rate or draining (EFF) of the tank. The diameter of the influent tank is approximately 78 inches. The cross-sectional volume of the tank is approximately 33.1 cubic feet per vertical linear foot. Therefore the flow rate calculated based on an approximation. This Combined instantaneous influent flow rate represents the combination with both force man in pipes from recovery well RPW4 and since the startup of GWISZ2 on 111/10209, approximately 50% of the Combined instantaneous influent flow Ret or GWISZ2.
- 3. Prior to November 2019 the total mass of PFAS removed is calculated based on the calculated based on the calculated based on the calculated based on the effluent flow rate.

 4. NA or Not Applicable.

 5. NR— Not Reported

 6. As of April 1, 2019: the system's O&M data reporting was changed to include the differential pressure readings from the bag filter unit's pressure gauges before and after the bag filters are changed/replaced, if applicable.

 6. As of April 1, 2019: the system's O&M data reporting was changed to include the differential pressure readings from the bag filter unit's pressure gauges before and after the bag filters are changed/replaced, if applicable.

 7. Prior to November 2019, the average influent flow rate could not reliably be calculated/measured from September to (most of) October due to a blockage in the Site glass on the EO tank from accumulated iron-oxide precipitates in the bottom of the tank. The iron-oxide precipitates were removed from the EO tank on Oct. 28, 2019.

 8. Following the separation of the two force mains and the installation of GWIPS #2 on November 7.2019, Instantaneous influent flow rate as calculated or indicated from the beystem's effluent flow rate is calculated or indicated from the beystem's effluent flow rate is calculated from the net galinos (Total Gallons Treated) obtained from the system's effluent flow rate is calculated from the net galinos (Total Gallons Treated) obtained from the system's effluent flow rate is calculated from the net galinos (Total Gallons Treated) obtained from the system's effluent flow rate is calculated from the net galinos (Total Gallons Treated) obtained from the system's effluent flow rates is calculated from the net galinos (Total Gallons Treated) obtained from the system's effluent flow rates is calculated from the net galinos (Total Gallons Treated) obtained from the system's effluent flow rates is calculated from the net galinos (Total Gallons Treated) obtained from the system's effluent flow rates is calculated from the net

Notes:

1. GWTT - Groundwater Treatment Technologies
2. Pressure readings before filter bag changeout or if no changeout was done.
3. Influent flow is an instantaneous estimate of the flow rate from the submersible Well Pump at PRW-4.
4. During monthly reporting periods the net against are calculated from previous effluent totalizer reading. (Difference between the current totalizer reading - the last dated totalizer reading).
5. The Average effluent flow rate is calculated from the net gallons obtained from the system's effluent totalizer flow meter and days that the system was in operation.
6. The "Totals" shown (from left. In right) include the. Total Days of System Operation. Average instantaneous influent flow rates are estimated by approximating 50% of the influent flow rate values calculated from GWPTs #1 (See Table 2A).
8. Instantaneous influent flow rates are estimated by approximating 50% of the influent flow rate values calculated from GWPTs #1 (See Table 2A).
9. Flow calculated based on gallons marking on CD tank: Estimated flow rate - 25 GPM (i.e. flow is calculated based on gallons marking on CD tank: Estimated flow rate - 25 GPM (i.e. flow is calculated from the first monitoring date are based on measurements from the last monitoring date of the previous reporting period.

Notes

- 1. Prior to June 11, 2018, the USEP A established the EP A Health Advisory for two PFAS chemicals, PFOA and PFOS, which was 70 ng/L. Subsequently, Mass DEP's Office of Research and Standards (ORS) expanded on this Health Advisory
- and created the ORS Guideline that applies to the total summed of five PFAS chemicals, PFOS, PFOA, PFNA, PFHxS, and PFHpA, effective June 11, 2018.
- 2. The USEP A and MassDEP ORS Guideline applies to five PFAS chemicals of concern (PFOS, PFOA, PFNA, PFHPA, and PFHxS) individually as well as the sum of the five PFAS of concern.
- 3. The complete PFAS concentration data set collected from PRW-4 is detailed in the data table titled "Summary of Groundwater Pump and Treatment System PFOS/PFOA Analytical Data. Data presented herein is summarized and data was selected based on quarterly sampling events.
- 4. (--) Concentrations of the three additional PFAS chemicals, PFNA, PFNAS, and PFHpA were not presented until after the MassDEP ORS Guideline was in effect on 0.6.11.18. PFAS concentrations of PFDA were not presented prior to April 19, 2019. MassDEP released drafted Method 1 groundwater risk standards for PFAS on April 19, 2019 that applies to the total sum and individual concentrations of six PFAS compounds (PFOS, PFOA, PFNA, PFNAS, PFNA, PFNAS, PFNAP, PFNAS, PFNAP, PFNAS, PFNAP, PFNAP
- 5. BRL Below Laboratory Detection Limits
- 6. Concentrations presented in ng/L nanograms per Liter parts per trillion
- 7. Concentrations in bold exceed applicable Health Advisory Limit or Method 1 GW-1 Standard
- 8. PFOS Perfluorooctanesulfonate
- 9. PFOA Perfluorooctanoic Acid
- 10. PFNA Perfluorononanoic Acid
- 11. PFHxS Perfluorohexanesulfonic Acid
- 12. PFHpA Perfluoroheptanoic Acid
 13. PFDA Perfluorodecanoic Acid
- 14. NA Concentration data not available
- 15. Monitoring well HS-1, HS-2, HS-25, and HS-6 were destroyed or removed during soil removal activities in January 2017 as part of an Immediate Response Action Plan. The well was replaced with HSW-1/HS-1 as post-exacavation activities.
- 16. Monitoring well HW-1D is a downgradient well located on the north side of Mary Dunn Pond.
- 17. NE- Not Established

1. Concentrations depicted represent the sum of the perfluorooctanesulfonic acid (PFOS) and the perfluorooctanic acid (PFOA) compounds in micrograms per liter (µq/L).

2. Concentration data points at 0 µg/L from Midpoint sample location, indicate a sample was not collected from the Midpoint location on that date or was detected below laboratory reporting limits.

Figure 6 - ΣPFAS Concentrations in PFW-1 from June 2018 - May 2021

Time (Months)

Barnstable County Fire & Rescue Training Academy 155 South Flint Rock Road, Barnstable, MA RTN 4-26179

Notes

^{1.} Concentrations depicted represent the sum of the the five (5) PFAS compounds, PFOS, PFOA, PFHpA, PFHxS, and PFNA from June 2018 to April 2019. Concentrations depicted from April 2019 to current graphical date represent the sum of the six (6) PFAS compounds PFOS, PFOA, PFHpA, PFHxS, PFNA, and PFDA.

^{2.} Concentrations are in in micrograms per liter (µg/L) or parts per billion (ppb).

Figure 7 - ΣPFAS Concentrations in OW-8A from January 2019 - May 2021

Time (Months)

Barnstable County Fire & Rescue Training Academy 155 South Flint Rock Road, Barnstable, MA RTN 4-26179

Notes:

^{1.} Concentrations depicted represent the sum of the the five (5) PFAS compounds, PFOS, PFOA, PFHpA, PFHxS, and PFNA from June 2018 to April 2019. Concentrations depicted from April 2019 to current graphical date represent the sum of the six (6) PFAS compounds PFOS, PFOA, PFHpA, PFHxS, PFNA, and PFDA.

Immediate Response Action (IRA) Transmittal Form

Pursuant to 310 CMR 40.0424 - 40.0427 (Subpart D)

BWSC 105

Rele	ase 7	Tracking Nu	nbei
4	-	26179	

E. LSP SIGNATURE AND STAMP:

I attest under the pains and penalties of perjury that I have personally examined and am familiar with this transmittal form, including any and all documents accompanying this submittal. In my professional opinion and judgment based upon application of (i) the standard of care in 309 CMR 4.02(1), (ii) the applicable provisions of 309 CMR 4.02(2) and (3), and 309 CMR 4.03(2), and (iii) the provisions of 309 CMR 4.03(3), to the best of my knowledge, information and belief,

- > if Section B of this form indicates that an Immediate Response Action Plan is being submitted, the response action(s) that is(are) the subject of this submittal (i) has (have) been developed in accordance with the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000, (ii) is(are) appropriate and reasonable to accomplish thepurposes of such response action(s) as set forth in the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000 and (iii) complies(y) with the identified provisions of all orders, permits, and approvals identified in this submittal:
- > if Section B of this form indicates that an Imminent Hazard Evaluation is being submitted, this Imminent Hazard Evaluation was developed in accordance with the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000, and the assessment activity(ies) undertaken to support this Imminent Hazard Evaluation comply(ies) with the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000;
- > if Section B of this form indicates that an Immediate Response Action Status Report and/or a Remedial Monitoring Report is(are) being submitted, the response action(s) that is (are) the subject of this submittal (i) is (are) being implemented in accordance with the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000,(ii) is (are) appropriate and reasonable to accomplish the purposes of such response action(s) as set forth in the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000 and (iii) comply(ies) with the identified provisions of all orders, permits, and approvals identified in this submittal:
- > if Section B of this form indicates that an Immediate Response Action Completion Statement or a request to Terminate an Active Remedial System or Response Action(s) Taken to Address an Imminent Hazard is being submitted, the response action(s) that is(are) the subject of this submittal (i) has (have) been developed and implemented in accordance with the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000, (ii) is(are) appropriate and reasonable to accomplish the purposes of such response action(s) as set forth in the applicable provisions of M.G.L. c. 21E and 310 CMR 40.0000 and (iii) comply(ies) with the identified provisions of all orders, permits, and approvals identified in this submittal.

I am aware that significant penalties may result, including, but not limited to, possible fines and imprisonment, if I submit information which I know to be false, inaccurate or materially incomplete.

Remarks:

Bureau Veritas is accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Bureau Veritas are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Bureau Veritas' profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Bureau Veritas in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Bureau Veritas liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Bureau Veritas has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Bureau Veritas, unless otherwise agreed in writing. Bureau Veritas is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

- * RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
- (1) Per- and polyfluoroalkyl substances (PFAS) identified as surrogates on the certificate of analysis represent the extracted internal standard.

(1) Extracted internal standard analyte recovery was below the defined lower control limit (LCL). Laboratory spiked water resulted in satisfactory recovery of the extracted internal standard analyte. When considered together, these QC data suggest that matrix interferences may be biasing the data low for the associated native analytes (PFTrDA, PFTeDA).

GENERAL COMMENTS

Samples received in cooler 1 of 2 were received with elevated temperature. Client consented to proceed with analysis.

Sample PQO460 [INFLUENT PRW-4]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, sample required dilution. Detection limits were adjusted accordingly.

Sample PQO461 [SYSTEM#1 MIDPOINT]: Per- and polyfluoroalkyl substances (PFAS): Due to high concentrations of the target analytes, sample required dilution. Detection limits were adjusted accordingly.

Sample PQO460, Low level PFOS and PFOA by SPE/LCMS: Test repeated. Sample PQO461, Low level PFOS and PFOA by SPE/LCMS: Test repeated. Sample PQO462, Low level PFOS and PFOA by SPE/LCMS: Test repeated.

Sample PQO463, Low level PFOS and PFOA by SPE/LCMS: Test repeated.

Sample PQO464, Low level PFOS and PFOA by SPE/LCMS: Test repeated.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

(1) Extracted internal standard analyte recovery was below the defined lower control limit (LCL) which may result in increased variability of the associated native analyte result (PFOSA).

Site Location: BARNSTABLE, MA

RE: Immediate Response Action Status and Remedial Monitoring Report #54

Barnstable County Fire and Rescue Training Academy

155 South Flint Rock Road Barnstable, Massachusetts DEP Release Tracking No. 4-26179

Project File #6206

Dear Mr. Ells,

As required by the Massachusetts Contingency Plan (MCP) 310 CMR 40.1403(3)(e) and 40.1403(6), BETA Group, Inc.(BETA) is notifying you on behalf of our client, Barnstable County, that an Immediate Response Action (IRA) Status and Remedial Monitoring Report (RMR) No. 54 is being submitted to the Massachusetts Department of Environmental Protection – Bureau of Waste Site Cleanup (MassDEP – BWSC) for the release site referenced as the Barnstable County Fire and Rescue Training Academy (BCFRTA) located at 155 South Flint Rock Road in Barnstable, Massachusetts (the site). This Report summarizes the IRA activities that occurred during the May 2021 monthly reporting period.

Pursuant to the Massachusetts Contingency Plan (310 CMR 40.0480), an Initial Site Investigation has been performed at the site. A release of oils and/or hazardous materials has occurred at the site. In August 2016, MassDEP Southeast Regional Office issued a Notice of Responsibility (NOR) to Barnstable County, as current owner and operator of the Barnstable County Fire and Rescue Training Academy (BCFRTA), that the detection of elevated concentrations of poly- and perfluorylalkyl substances (PFAS) in groundwater at the site constituted a release under the MCP. MassDEP issued Release Tracking Number (RTN) 4-26179 to this release. As summarized in the NOR, based on the detected PFAS concentrations in soil and groundwater at the BCFRTA and the inferred groundwater flow, MassDEP determined that the releases of PFAS from the use of aqueous film-forming foam (AFFF) at the BCFRTA is a source of PFAS detected in the Mary Dunn wells.

During the May 2021 reporting period, the two treatment systems, GWTS #1 and GWTS #2, were in operation for all or portions of 31 days. The overall (average) system flow rate and gallons of groundwater treated are based on the available Effluent flow totalizer readings reported for both systems by the O&M contractor. For the May 2021 reporting period both systems treated an approximate combined 0.71 million gallons of groundwater from the downgradient recovery well PRW-4 at an average, total (of the two systems) effluent flow rate of 15.4 gpm. Based on the total 0.71 million gallons treated, approximately 0.003 kilograms of PFAS were estimated to have been removed from the plume area.

At this time, IRA activities are ongoing. Continuing IRA activities will include operation and monitoring of the on--Site Groundwater Pump and Treatment Systems (GWPTS), including performance sampling of GWPTS, review and evaluation of the on-Site GWPTS operation and maintenance activities as they affect groundwater treatment, and periodic groundwater monitoring. Additional details regarding the continuing IRA activities are included in the IRA Status and RMR No. 54 report document.

The IRA Status and RMR document is available electronically via the searchable sites database of the MassGOV / MassDEP website via the following link:
